PRECISION, QUALITY, INNOVATION

For more than 135 years, manufacturers, builders and craftsmen worldwide have depended upon tools from the L.S. Starrett Company to ensure the consistent quality of their manufacturing processes.

They know that the Starrett name on force and material testing, precision hand tools, metrology equipment, hand tools, power tool accessories, saws, laser measurement, and gage blocks means exceptional quality, innovative products and expert technical assistance.

With strict quality control, state-of-the-art equipment and an ongoing commitment to producing products with superior quality, the 5,000 plus products in today's Starrett line continue to be the most accurate, robust and durable tools available.

This catalog features Starrett Force and Material Testing Systems, their applications and characteristics.

DIGITAL FORCE GAGES

Digital Force Gages available in 2lbf to 500lbf capacities, for hand held use, manual force stands or motorized force stands.

13

MANUAL FORCE STANDS

Manual force stands available in three capacities, 110lbf, 330lbf and 550lbf for use of the Digital Force Gages

19

MOTORIZED TEST STANDS

Material Measurement and force measurement test frames available in 500N, 1000N, 2500N, 5kN, 10kN, 30kN, and 50kN capacities.

23

33

LOAD CELLS

Starrett load sensors are supplied with a NIST-traceable Certificate of Calibration. All sensor types are "plus and play" and are available in 5N to 50kN capacities.

61

PLATENS

Made from aluminum and steel for compression applications; available in fixed or self-leveling for soft samples, cardboards, plastics, steel, stone, foam, and more.

65

ECCENTRIC ROLLERS

An excellent self-tightening fixture for materials that deform under load, idea for flat samples, rollers available in smooth, rubber, or serrated jaw faces.

75

WISE-ACTION FIXTURES

A very easy sample loading option, these grips are tightened manually and keep alignment simple, jaw faces come in a variety of sizes and surface finishes.

81

WEDGE-ACTION FIXTURES

Designed for easy loading and alignment these fixtures can be equipped with smooth, serrated, v-notch, diamond-coated and rubber jaw faces. Wedge-action fixtures apply an increasing clamping pressure on the sample as they are pulled axially.

101

ROPE AND BOLLARD FIXTURES

Use these for testing materials like rope, cable, filaments, yarn and more. They are designed to ensure proper sample alignment and promote a correct sample break.

107

BUTTON FIXTURES

These fixtures are designed to test the tensile strength of electrical connectors such as wire connectors that are crimped on to wires.

113

FLEXURAL FIXTURES

Used in 3 and 4 point bending testing a flexible testing solution with adjustable spans. Determine strength, deformation, or even flexural modulus with these grips.

115

PEEL FIXTURES

These are suitable for determining adhesive strength on a variety of adhesive tapes, thin film coatings, copper runners and more. Fixed 90° and adjustable models are available.

119

PNEUMATIC FIXTURES

Pneumatic actuation is used to open and close the jaw faces on these grips, ideal for high volume testing and maintaining a consistent clamping pressure.

127

SPRING TEST FIXTURES

Custom solutions for tension and extension springs, these ensure correct axial alignment for accurate measurements of spring constants, initial tension and free length.

151

SYRINGE TEST FIXTURES

These are designed to make loading and unloading easy, test in tension and compression, stand sizes available or custom on request.

153

SCISSOR FIXTURES

Self-tightening grips with a large variety of jaw faces available, great for general purpose testing of elastomers, plastic, rubber, textiles and more.

155

COEFFICIENT OF FRICTION (COF)

These fixtures meet ASTM, TAPPI, and ISO application standards for determining COF and films, substrates, ceramics, and slip resistant finishes.

159

FOOD TEXTURE FIXTURES

Use these fixtures to measure food characteristics like shear, brittleness, softness, crispness and more.

163

HOOK ADAPTERS

A good general purpose option available in clevis and threaded mounting options.

169

CLEVIS ADAPTERS

Used to secure most of the testing fixtures available to the test frame and the load cell in Starrett systems, these provide a quick and easy way of swapping setups.

173

FORCE GAGE ADAPTERS

These are used to mate dissimilar threaded connections available in male-to-male and male-to-female.

177

CABLES

For data exporting, or communications between DFx hand-held force gages and test frames.

181

GAGE ADAPTER PLATES AND MOUNTING BLOCKS

Adapter plates for mounting competitive gages to the Starrett FMM motorized force test frame.

Mounting block options for L1 systems and FMM motorized force test frame.

183

TESTER ACCESSORIES

Bench clips for motorized stands and horizontal legs for manual stands.

185

SAFETY SHIELDS & EXTENSOMETERS

TERMINOLOGY

195

PRODUCT LINES

Vision Systems

Starrett vision systems combine high-resolution images with robust, precision mechanical platforms. We offer a full range of systems from video microscopes to large 50 x 36" (1270 x 915mm) platform systems and our Mx digital metrology software.

Granite Surface Plates

Starrett granite surface plates are available in three levels of accuracy: Grade AA (Laboratory), Grade A (Inspection) and Grade B (Tool room). Our Crystal Pink granite has the highest percentage of quartz of any granite so it has the best balance of physical properties, maximum resistance to wear and for deflection under load.

Indicators

Starrett manufactures an array of gages and indicators for exacting measuring applications. We offer test indicators, back plunger indicators, dial indicators, and accessories. We can supply analog and digital indicators, plus special application indicators for your application requirements.

Optical Comparators

Starrett optical comparators are ideal for a wide range of dimensional inspection applications. Starrett offers optical systems from 16-30" (400-750 mm) diameters, horizontal and vertical models.

Height Gages

For simple or complex height measurements, Starrett supplies a range of electronic height gages and accessories, including the DIGI-CHEK system- the world's fastest and most precise height masters.

Laser Measurements

Starrett is a leader in non-contact laser measurement systems such as our Profile 360 system. The system continuously monitors the size and shape of complex profiles to ensure quality and consistency in width, thickness, gap, radius, angle and more.

Bore Gages

Our AccuBore electronic bore indicators is a high-quality, trigger-activated, three-point contact bore gaging system. Starrett can supply a wide range of bore gage systems that ensure a more true alignment.

Webber Gauge Blocks

Starrett precision gage blocks are trusted for their accuracy, surface finish, wear resistance and dimensional stability. Our croblox® gage block is the world's premier gage block with industry-leading accuracy and stability.

Precision Tools

Starrett has a comprehensive range of micrometers and calipers that meet or exceed accuracy and performance specifications of national and international standards.

OVERVIEW

STARRETT INNOVATION. PRECISION.

ACCURACY. EASY TO USE.

Starrett offers a wide range of equipment that is easy to setup, operate, and maintain. These force and material measurement products includes hand held force gages, mechanical stands, motorized stands, and a complete range of software and accessory options suitable for any application.

DIGITAL FORCE GAGES

Real Time View

Primary window shows active load being applied to the load cell. The secondary window shows the measured peak in tension made - 36.51 lbf.

Tension Peak View

Shows maximum load measured in primary window. Secondary window shows real time load.

Compression Peak View

Shows maximum load measured in primary window. Secondary window shows real time load.

Tolerance View

When a tolerance is used, out-of-tolerance results display in red.

DFG DIGITAL FORCE CONTROLLER

The DFG is our basic force gage. The gage measures force at an accuracy of better than 0.2% full scale.

The DFG is ideal for basic tensile and compression testing. Test setup and operation is fast, efficient and easy for anyone. The DFG display shows the test direction and dynamic load during testing. Results are displayed at the completion of testing, including "Pass-Fail" when tolerance is applied. The gage will display statistics when results are saved to the gage's internal memory. Store up to 50 test results in local memory.

DFC DIGITAL FORCE CONTROLLER

The DFC is our advanced force gage. The gage measures force to an accuracy of better than 0.1% of full scale.

In addition to the DFG features, the DFC supports Bluetooth® output, 99 results saved in memory, and can be used to control the Starrett FMM motorized test for basic load distance and break testing.

FEATURES

- Use as handheld instrument or mount to Starrett test frames: FMM, MTL and MTH.
- Excellent display resolutions:
 - DFC 10,000:1
 - DFG 5,000:1
- Precise and accurate load measurements:
 - DFC 0.1% full scale
 - DFG 0.2% full scale
- Load sensors have safe overload rating of 200%
- High-resolution OLED color display with adjustable backlight and Auto Off feature
- Supplied with NIST-traceable Certificate of Calibration
- 3-year warranty
- Metric threads for screw-on attachments. Can be fitted with clevis adapters that fit hundreds of Starrett test fixtures.
- A primary and secondary display window shows your results. Out-of-tolerance results display in red.
- Adjustable sampling rates help you capture peak loads. Filters can be applied to peak and display values.
- Multiple display languages.
- Battery provides more than 30 hours of continuous operation. Charge battery using USB cable.
- Change display (Flip feature) orientation without having to expose electronics.
- Easy-to-use multi-function keypad. Softkeys are programmable to your most used functions.
- Programmable sounds for alarms, such as an out-of-tolerance result
- Cast-aluminum housing
- Comfort grip for handheld testing applications.

The USB connection is used for charging the battery or for transmitting data to a personal computer. The RS-232 cable is used for connection to the FMM Digital Tester. The DFC also has Bluetooth®.

DIGITAL FORCE GAGES

SPECIFICATIONS

Digital Force Gages		
Specification	DFC	DFG
Accuracy, Full Scale	0.1%	0.2%
Data Sampling (Hz)	25,000	10,000

Operating Temperature	40°F to 110°F (4°C to 43°C)	
Thread, for adapters	Metric M6, M10	
Instrument Weight (approx.)	3lbs (1.36kgs)	

NOTES

- Machine control is exclusive to the DFC. When connected to the FMM Digital Force Tester, configuration of force gage and tester is performed through the gage.

ACCESSORY KITS

The DFC and DFG Force Gages are supplied with a complete accessory kit. The kit includes a hook, notch, chisel, flat, and point adapter. A 6" extension rod is included. Adapter materials are stainless steel. Aluminum is used for 2lbf (10N) and 10lbf (50N) capacities.

Included with the force gage is a carrying case, USB cable, a set of testing accessories, a Quick Reference Guide and NIST-traceable Certificate of Calibration.

Force gage standard accessories

DFC - Advanced Force Controller

MANUAL TEST STANDS

MANUAL FORCE TESTERS

MTL MANUAL TESTERS

The MTL Manual Testers are single column, manually-operated force testers. These testers operate with a quick-action lever in either tension or compression directions. Two models are available- the MTL-110 and MTL-330. Force measurement is performed using a Starrett DFC or DFG digital force gage.

MTL-110

The MTL-110 can measure force up to 110lbf (500N, 50kgf). This tester is ideal for component testing and its compact design fits small work spaces. The MTL-110 has a 6" (152mm) stroke. The tester's quick-action lever moves the rack and pinion crosshead 3" (76mm) per revolution. The lever may be positioned anywhere along the 20" (508mm) column, and with a 6" (152mm) throat, large samples can be accurately tested. Options include a digital scale for measuring deflection distance. The base adapter adjusts to accommodate different gage models.

MTL-330

The MTL-330 can measure force up to 330lbf (1500N, 150kgf). This tester can be used for tensile and compression testing applications, and is ideal for spring testing. Fit the MTL-330 with a Starrett digital force gage and optional digital scale to determine spring rates, initial tension and more. The MTL-330 can be easily mounted to your workbench for secure testing.

Like the MTL-110, the quick-action lever moves the rack and pinion crosshead 3" (76mm) per revolution. The lever may be positioned anywhere on the 30" (762mm) column, and with a 4" (102mm) throat, large samples can be accurately tested. Optional gage adapter kits are available for use with non-Starrett force gages.

The MTL may be equipped with optional legs so that you can test in a horizontal position.

FEATURES

- Two Capacities: 110lbf, 330lbf (500N, 1500N)
- Compact Design is Ideal for Lean Manufacturing Environments
- Lever-type, Quick-action Crosshead Movement
- Precision Rack and Pinion
- Excellent Position Resolution: Single Rotation for 3" (75mm)
- Adjustable Gage Mounting

MTL - Manual Force Tester, Lever Control															
Model No.	Load Capacity			Crosshead Travel		Resolution/Rotation		Throat		Weight		Vertical Test Space (max.)		Thread	
	N	KGF	LBF	in	mm	in	mm	in	mm	lbs	kgs	in	mm	mm	
MTL-110	500	50	110	6	152	3	76	4	102	18	8.2	9	230	M6, #10-32	
MTL-330	1500	150	330	6	152	3	76	4	102	20	9.1	15	381	M10	

MTH MANUAL TESTERS

The MTH Manual Tester is a single column, manually-operated force tester. The MTH has a load measurement capacity of 550lbf (2500N, 250kgf) and can be used for compression or tensile testing. The mechanical advantage afforded by the MTH-550's precision, high-resolution worm gear design lets you test effortlessly. One rotation of the hand wheel positions the crosshead 0.03" (0.75mm). Total stroke for the MTH-550 is 4" (102mm). Force measurement is performed using a Starrett digital force gage.

The MTH-550 is an ideal, affordable solution for spring testing. Fit the MTH-550 with a digital force gage and optional digital scale to determine spring rates, initial tension and more.

The hand wheel may be positioned anywhere along the 30" (762mm) column, and with a 4" (102mm) throat, large samples can be accurately tested. The base may be permanently affixed to your workbench. Optional gage adapter kits are available for use with non-Starrett force gages. Quick-change clevis adapters let you mount a large selection of Starrett testing fixtures.

FEATURES

- Tension or Compression Testing
- Excellent for Cost-Effective Spring Testing
- Effortless Crosshead Movement
- Precision Worm Gear Design
- Excellent Position Resolution: Single Rotation for 0.03" (0.75mm)
- 30" (762mm) Column Height, 15" (380mm) Working Area
- Adjustable Gage Mounting

The MTH-550 may be equipped with optional legs so that you can test in a horizontal position.

Starrett can supply a wide assortment of testing fixtures that comply with international testing standards from ASTM, ISO, DIN, TAPPI and more. We can also supply custom test fixtures for difficult sample shapes.

FMM FRAME OVERVIEW

FMM digital force testers are compact and ideal for high volume, lean manufacturing production. FMM Digital Force Testers may be used manually, with a DFG or DFC digital force gage, or any of the Lx software versions, L1, S1, L2, S2, L2Plus and L3.

FMM testers are available in three capacities: 110lbf (500N), 330lbf (1500N) and 550lbf (2500N). Two travel lengths are available for all capacities: standard travel at 20" (508mm) and extended travel at 30" (762mm). Crosshead speeds are controlled locally and can be set from 0.002 to 40 inch/min (0.05 to 1016mm/min). Quiet even when operating at full speed. Easily upgrade from force gage control to computer based operating using Lx software.

Adjustable over-travel limits prevent accidental overloading

Equipped with optionally available splinter shield

Reference Ruler

User-adjustable corrections for linear error and deflection compensation

Two mounting block options for:
- Force Gages
- BLC Load Cells

Tablet PC mount for L1, S1, L2, and S2 Software

Adjustable base plate ensures correct sample alignments

Base clevis adapter kit supplied standard

Emergency Stop

Cast aluminum base with bench clip to secure work space

Speed Selection dial with high resolution display

Manual jog switches with excellent tactile feedback

FMS/MMS FRAME OVERVIEW

Accurate and easy to use. When you need an easy-to-use measurement system for accurately and precisely determining simple load, distance, and break applications or more complex material testing applications like Young's Modulus, tensile strength, stress, or strain the FMS and MMS series test frames are the answer. Available in 1000N (225lbf), 2500N (562lbf), and 5000N (1124lbf) capacities.

The FMS series test frame supports L2, S2, L2Plus, and L3 versions of the Lx software. The MMS is the material testing version with higher accuracy encoders and extensometer support to work in conjunction with the Starrett L3 software. It's the accuracy, repeatability, and simplicity you expect from L.S. Starrett.

FMD/MMD FRAME OVERVIEW

The FMD and MMD series test frames are suited for simple force and distance applications and more complex material testing applications. The FMD series test frame supports L2, S2, L2Plus, and L3 versions of the Lx software, pair it with the software version that best suits your testing needs. Available in 10kN (2,250lbf), 30kN (6,750lbf), or 50kN (11,250lbf) capacities.

MMD frames include extensometer support to work in conjunction with the L3 material testing software. The twin post design features a large 16.7 in (424mm) testing area between the columns and space on the granite base for sample preparation or staging.

STANDARD TRAVEL

EXTENDED TRAVEL

SHORT TRAVEL

The L1-Base-M is included standard on all FMM motorized test stands. Access the M4x0.7, M6x1, M10x1.5, or M12x1.75 threads by rotating the baseplate 90 degrees.

The L1-Base-US is an optional accessory. Access the #10-32, 1/4-23, 5/16-18, or 1/2-20 threads by rotating the baseplate 90 degrees.

SOFTWARE

CREATE. TEST. ANALYZE. REPORT.

L3 SOFTWARE

L3 Systems are optimized for users involved with material testing and characterization- the research engineer, the design engineer, the quality control technician, the test technician and others.

L2 PLUS SOFTWARE

L2 Plus Systems provide engineering and quality personnel with an easy-to-use, yet comprehensive solution for complex force analysis and measurement.

L2 SOFTWARE

L2 Systems are ideal for demanding force measurement testing. Create complex testing methods or use our standard test templates for all types of force measurement applications.

L1 SOFTWARE

L1 Systems are great for quality control and incoming inspection. They are engineered to meet the requirements for fast, efficient, high-volume production testing. Combining functionality with affordability.

S2 SOFTWARE

S2 Systems are application-specific solutions for testing compression and extension springs. Measure spring rate, spring constant, initial tension, free length and more.- fast and efficiently.

S1 SOFTWARE

S1 Systems represent our most basic digital testing solution for compression and extension springs. S1 systems are ideal for high-volume production testing and individuals looking for more consistent testing results.

DFC CONTROL

The DFC control option utilizes the DFC hand held force gages universal interface for basic load, distance and break testing. A great entry level economic solution.

L3 SOFTWARE

Starrett L3 systems represent a new and easier solution for creating a test; performing a test; analyzing your test results; and managing test data.

L3 systems meet the requirements of today's research scientist, design engineer, quality manager or technician responsible for material characterization, verification and validation.

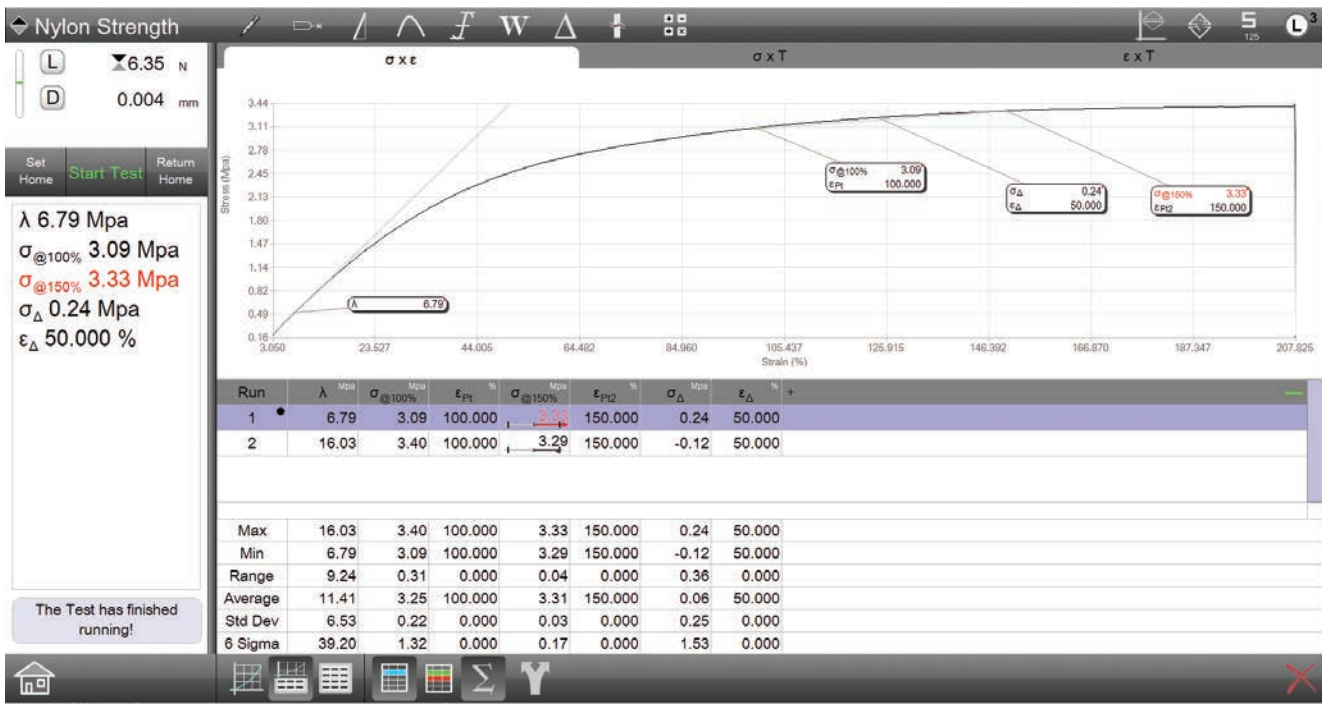

Unlike traditional material testing systems that involve programming and having to know exactly what measurements are required before the test, L3 systems employ a simple methodology. You create your test method. Your test method creates your graph. And then you measure on the graph using a set of analysis tools.

You can measure any point and any segment anywhere along the graph. Analyze using stress, strain, load, distance, and time. Your measurements are displayed on your graph and shown in data tables with statistics and tolerances.

FEATURES

- Measure stress, strain, load, elongation, extension, and time results using tension, compression, flexural, cyclic, shear, and friction applications
- Create test setups using internationally accepted testing standards from ASTM, ISO, DIN, TAPPI and more, or create your own custom test methods
- Measure and calculate results graphically:
 - Points
 - Modulus, Slopes and Intercepts
 - Offset Yield
 - Min/Max/Avg
 - Breaks (Rate, %Drop)
 - Peaks and Valleys
 - Deltas
 - Rates
 - Hysteresis
 - Work/Energy
 - and more
- Options for digital and analog I/O and Control Logic

Measure results using SI or Imperial units of measure. Display results in Engineering Notation if needed. Specify resolutions for any unit type.

(Above) Out-of-tolerance results are displayed in red, including a tendency bargraph in the data table.

(Below) The Tolerance view provides more detailed information as to "why" the result is displayed in red.

View results on any of these graph formats: Stress vs. Strain, Stress vs. Time, Strain vs. Time, Load vs. Displacement, Load vs. Time, Displacement vs. Time. Display full graphs or split graphs with the data table showing statistics and tolerance values.

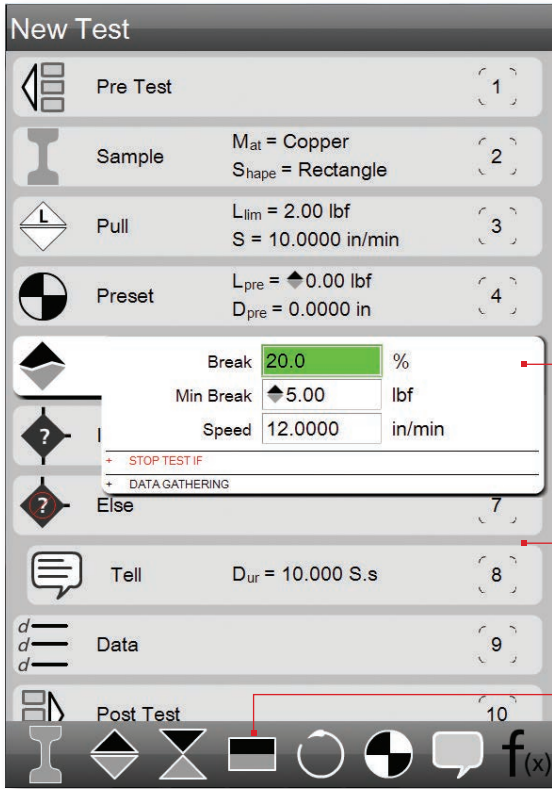

Statistics can be displayed and your raw data and results can be exported automatically using the Share function.

The operator can add comments about each test run, or use the Extra Coefficients function to display additional information for reporting. Standard reports are included, or export as a .csv file for use with Microsoft® Excel®, Word®, Access or your 3rd-party SPC application.

Construct simple and complex multi-step test setups. Create your test method to an accepted standard or to your specific testing needs.

Create your test method and then email to other locations so that your testing is always performed in the exact same manner with the same measurements and results.

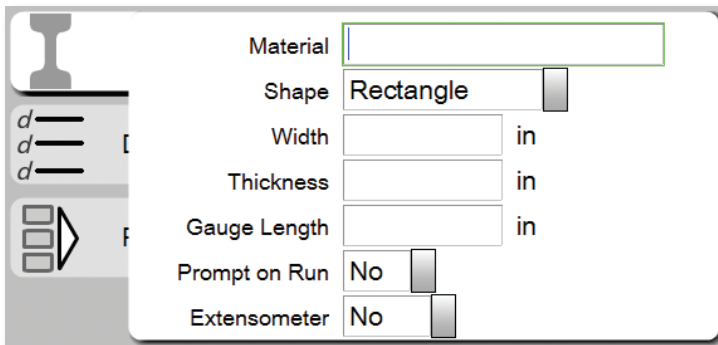

Tensile and Compression steps are used to perform "go to moves". Go to a Limit or Break at a velocity or load rate. You can choose exceptions for any move and decide whether to collect data during the move.

Shown is an operator prompt based on a conditional branching state. If the measured result is "out-of-tolerance", a message is displayed alerting the operator. If the result is within the tolerance range, no message is displayed.

Hold steps are used for creep and relaxation testing. You can hold at a limit for a specified duration up to 24 hours, if necessary.

Cycle based on any of your steps in your test method. You may cycle up to 1000 times or for a duration of up to 24 hours at a sampling rate of 1Hz. Each test may have a maximum of 100,000 data points.

The Sample Definition step lets you name your material, specify the shape and its dimensions. You can enter dimensions digitally using a Starrett micrometer, or caliper.

Shown is the setup dialog for the optional I/O step. It allows you to control and activate external devices such as annunciators through the test frame's digital or analog I/O channels.

Shown are the various test setup step types, including specialized steps available using the optional Automation Builder.

The Slope tool is used to find modulus. Multiple methods are available including automatic, chord, tangent, and best fit.

The Delta tool measures the differences between results. You can find creep by simply choosing this tool and the two points you want to compare.

Use the Annotation tool to add notes to any graph view.

Use the Min/Max/Avg tool to find maximum and minimum values. It can also be used to calculate averages of all data between a segment you specify.

You can compare multiple graphs of your test runs and measure delta and variances between tests at precise points. Ideal for benchmark analysis.

Use the Offset Yield Point tool to measure any data point on any of the three graph views. The point may be implicit or may be derived based on another result. For example, you can find the point at 100mS before the point at 100% strain.

Use the Work tool to determine the energy or resilience from your stress-strain graph.

Use the Formula Builder to create custom expressions and derived results using algebraic, trigonometric and logarithms.

The Peak/Valley tool is ideal for peel and coefficient of friction testing. Measure the maximum, minimum, average and counts of peaks and valleys.

Find break results based on a percentage drop or based on a load rate decrease.

The Offset Yield Point tool is used to measure the yield strength at a 2% strain offset. Shown is modulus at 100% and 150% and the delta between these two measurements.

L2PLUS SOFTWARE

SOFTWARE

Designed for advanced force measurement and analysis, L2 Plus Systems are optimized for quality and engineering personnel. Test setup is intuitive, efficient and non-compromising.

With L2 Plus systems you not only find the measurement, but you have the information that shows you "why, when and where" the measurement occurs.

Like our L3 systems, L2 Plus measurements and analysis are performed graphically using our Windows®-based, all-in-one computer workstation. Create high resolution graphs based on load, distance, height and time. Then measure any point or segment on your graph using a set of analysis tools.

FEATURES

- Ideal for tension, compression, rate control, flexural, cyclic, shear, and friction applications
- Measure and calculate results graphically:
 - Points
 - Slopes and Intercepts
 - Min/Max/Avg
 - Breaks
 - Peaks & Valleys
 - Deltas
 - Rates
 - Work/Energy
- Create test setups using internationally accepted testing standards from ASTM, ISO, DIN, TAPPI and more, or create your own custom test methods
- Options for digital and analog I/O and Control Logic
- Options for arithmetic, trigonometric and logarithmic calculations
- Use bar code scanning to access test setups

Perform advanced testing methods such as load rate control. Set a target limit then pull/push at a rate using load per time velocity.

Specific algorithms for peak & valley measurements are supported: find peak/valley, find maximum/minimum peak/valley, find averages for peaks/valleys.

Your results can be displayed in markers on your graph, in data tables, or in combinations. Graph types are: Load vs. Distance, Load vs. Time, and Distance vs. Time. Markers can display the load, distance and time to a specific point on the graph.

(Above) Use the Peak/Valley tool to locate the peaks for the entire test duration or for a defined segment within the test, per ASTM F88. Qualify your peaks and valleys using the sensitivity adjustment. Measure average, counts, maximum, minimum and more.

(Below) The load average is calculated for qualified peak values using a load sensitivity of 25%. Adjust for sensitivity using the data definition menu or by using the sensitivity adjustment bar on the y-axis. In this example, the load average is specified at a segment starting at the maximum load point (Lmax).

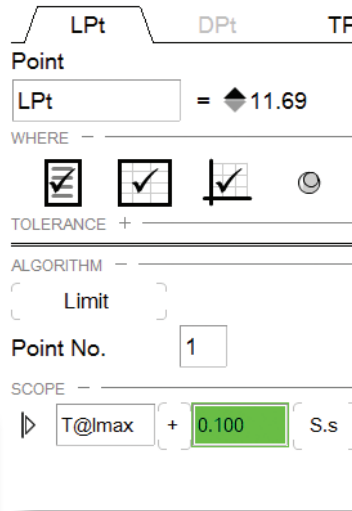

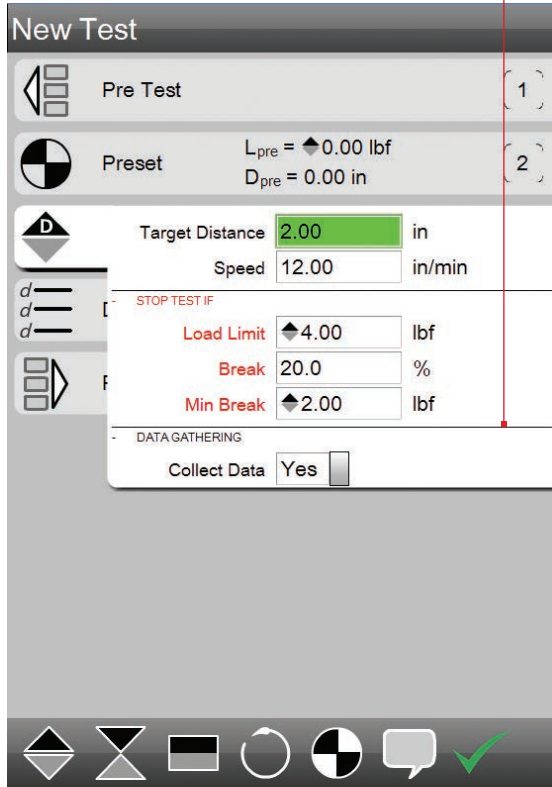

L2PLUS SOFTWARE

Your test step can include "exceptions" which help with test flow control. If an exception occurs the test run can automatically abort. Your test data may be saved and exported, or you can choose to disregard the test altogether.

Here the test exceptions are "abort if the Load reaches 4.00lbf, or if the sample breaks after first measuring 2.00lbf".

Two forms of Break analysis are supported:
%Drop from Maximum Load and Rate.

Scoping allows you to specify any point or segment of data from your graph for analysis. Measure based on load, distance and time.

Complex motion-control test steps may be performed, including load rate control. This test method lets you specify a load target and a velocity based on load rate. In this example, the target load is 15.00lbf and the test requires that you get to the target in 5 seconds, or a rate of 180.00 lbf/minute.

Make sure button is secured within test fixture

The Test has stopped because of an Exception
(press anywhere to continue)

System messages and prompts provide operators with alerts during testing. User prompts include ASK and TELL messages:

- ASK messages require an operator acknowledgement.
- TELL messages are displayed for a duration or until the operator acknowledges the message.

System messages display in red to alert the operator to alerts and warnings.

A bar code reader can be used to quickly load and launch your test setup. Ideal for busy, high-volume production applications where you are performing many test setups.

Measure these common results and more using your L2 Plus system:

- Absolute Peak
- Average Value (All Peaks)
- Average Value (Selected Peaks)
- Average Value (All Valleys)
- Average Value (Selected Valleys)
- Average Results (Regions)
- Break (Load)
- Break (Load/Extension Rate)
- Break (% Maximum)
- Coefficient of Friction
- Delta Creep
- Delta Relaxation
- Initial Peak
- Initial Valley
- Hold Preset Point
- Hysteresis Loss
- Slope Intersect
- Total Creep
- Total Relaxation
- User Calculations
- Work/Energy/Resilience

(Above) Anchoring is a scope feature. It allows you to easily measure from an existing result (anchor).

In this example, the load value is found at 100ms after the maximum load (Lmax). In the scoping operation for the point result (Lpt), the Lmax is used as an anchored result. The "+" sign signifies "after" the anchored Lmax. The scope value is specified as time (S.s) and entered as 0.1 second. You can scope on load, distance or time.

(Above) Using the "Multiview" function, you can measure using multiple graphs from your batch. Graph traces are overlaid onto one another and color-coded for identification. In this example, the delta variance is measured between the three test runs. The variance is measured at a point between the graph with the greatest value and the graph with the lowest value. This function can be used for "benchmark comparisons".

L2 SOFTWARE

Whether your application is high-volume in situ production, incoming inspection and validation, or just basic force measurement, the L2 System is an economical and easy-to-use solution.

L2 Systems feature a small footprint making them ideal for lean manufacturing environments. Create test setups in seconds using templates or create complex multi-stage test setups using the L2 Test Builder. No programming experience required.

L2 Systems operate using a Windows®-based tablet PC. Load, distance and time-based results are displayed in a large format for easy interpretation. Graphical representation of each test can be displayed. Data tables display results with tolerance and statistical calculations. Standard reports are included, or export data for use with other applications. System capacities range from 500N (112lbf) to 50kN (11,250lbf).

FEATURES

- Ideal for tension, compression, flexural, cyclic, shear, and friction applications
- Create test setups using internationally accepted testing standards from ASTM, ISO, DIN, TAPPI and more, or create your own custom test methods
- Measure and calculate results:
 - Min/Max/Avg
 - Breaks
- Options for digital I/O and Control Logic
- Options for arithmetic calculations

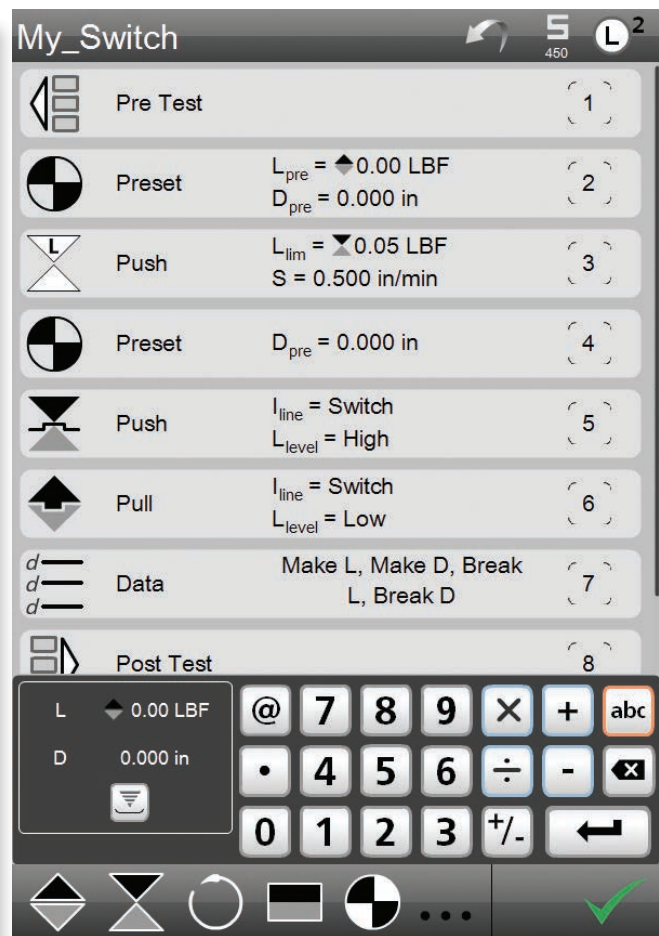

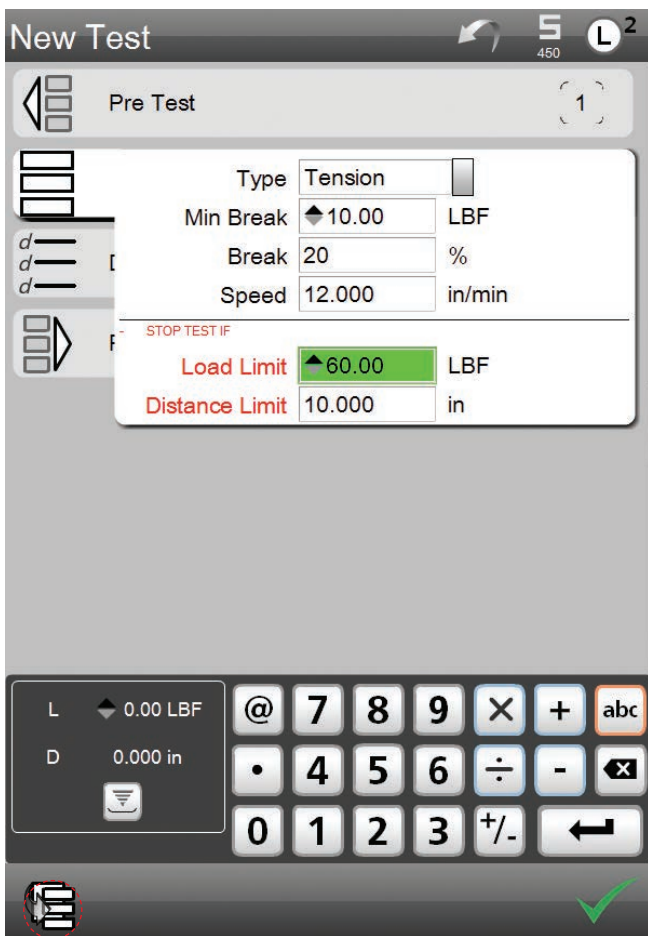

L2 systems can use a FMM, FMS, or FMD test frame. Shown is an L2 system using an FMS-2500 test frame.

The Starrett L2 system features a tablet computer featuring a 10-inch (254mm) color, touchscreen display. The system is WiFi®, Bluetooth® and USB compatible.

Perform common test methods such as determining maximum load, maximum deflection, average loads or how product reacts when a constant load is applied for a specified period of time.

L2 systems can determine break strengths and the sample's characteristics at load and extension limit values and provide you with immediate pass/fail indication.

The L2 system includes test templates- pre-configured test setups for load, distance and break limit testing. These can be used to setup a test in seconds. Simply fill in the blanks and your setup is complete. Use the Convert to Test Builder function and your test template is converted to a full Test Builder setup.

Use the Test Builder application supplied standard with L2 systems to construct simple and complex test setups. This example shows a contact closure test that also uses the optional Automation Builder and digital I/O. The Test Builder methodology is same across all Lx systems.

Done

Results, also called coefficients have default names. These can be changed using the Coefficient Settings function. You can rename a coefficient so that it is universally applied to all test setups.

Specialized functions, including deflection compensation or the ability to limit a load cell sensor are features to protect your instrumentation and to minimize operator errors. The Max Load Allowed feature can help prevent accidental load cell overloading.

File Locations L²

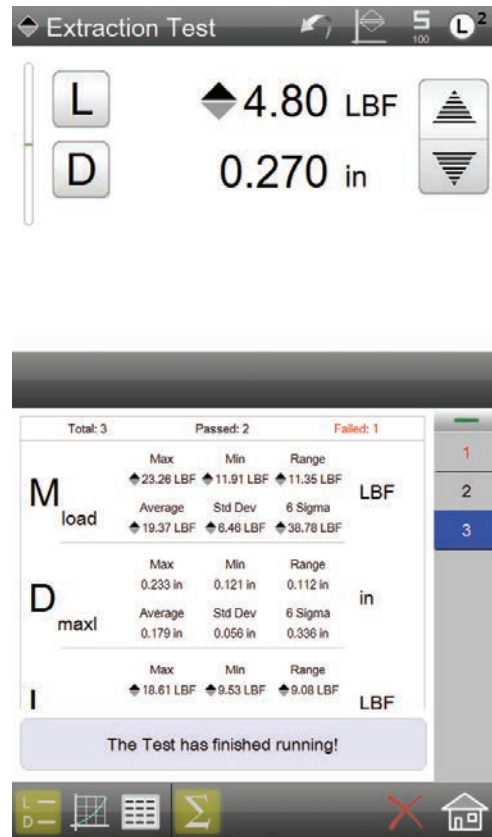

Category	Location
Backups	Backups
Exports	Exports
Runs	Runs
Tests	Tests

All Lx systems let you map where information is saved or exported to. Using the File Locations setting, you can specify how and where information is sent- automatically or on-demand. Test files, for example, can be created at a central location and then emailed to production facilities. This ensures that all manufacturing cells are using identical testing setups.

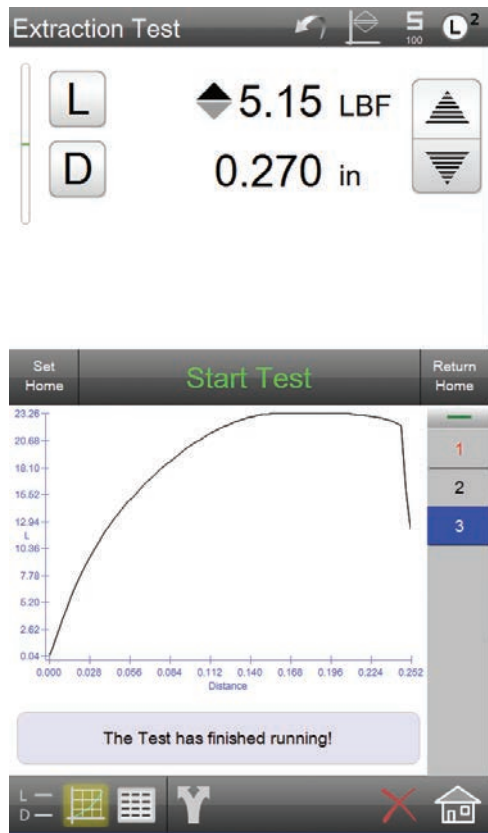

All Lx systems can display in multiple languages. A translation utility is included with all Lx systems. This allows custom translation to be performed so that dialect or specialized terms are universally applied to all displays.

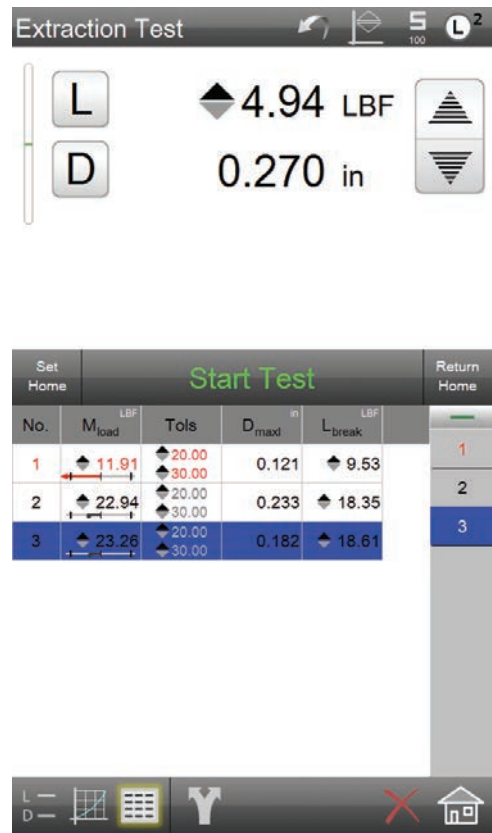

The Results view can be configured to display the most critical result in large text.

The Statistics view displays the results and their associated statistical values. The header displays the total, passed and failed test runs. Failed runs display in red.

L2 systems display a graph profile. Unlike the L3 and L2 Plus systems, no measurement can be performed from the graph. Selecting the Graph symbol changes the graph axes. Graphs may be overlaid.

The Tolerance view shows the results and the tolerance limits. Test runs that are "out-of-tolerance" display in red with a tendency bar graph for analysis.

L1 SOFTWARE

Starrett L1 Systems represent our most-basic, computer-based force testing solution. Optimized for production and quality control testing, they are designed to be easy to setup, operate and maintain.

L1 Systems can be used to perform a wide variety of testing methods including:

- Load Limit Testing
- Distance Limit Testing
- Break Limit Testing
- Cyclic Count Testing
- Cyclic Duration Testing
- Constant Load Testing
- Constant Distance Testing

BASIC ARCHITECTURE

Your Starrett L1 System is comprised of the following:

- FMM Digital Force Tester
- Base clevis adapter kit
- USB 2.0 communication cable
- BLC Load Cell Sensor
- Load cell mounting block
- 2-in1 Windows® 10 Tablet Computer
- Table computer to column mounting fixture
- L1 Application Software

Communication between the hardware is USB 2.0.

The 2-in-1 L1 tablet features a 10", high-resolution, touchscreen, color display with three USB 2.0 ports.

The L1 application software lets you create your test methods quickly using test templates that guide you through the test setup process. Create common test methods in seconds.

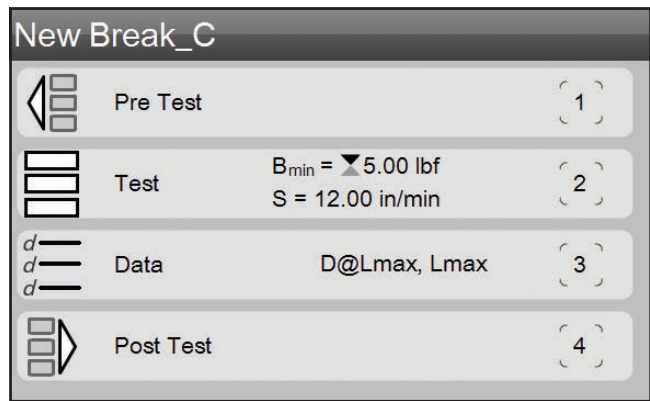

L1-550 system with FMM-550 test frame and L1 tablet and software. Test fixture and BLC Load Cell Sensor are optional.

L1 TEST TEMPLATES

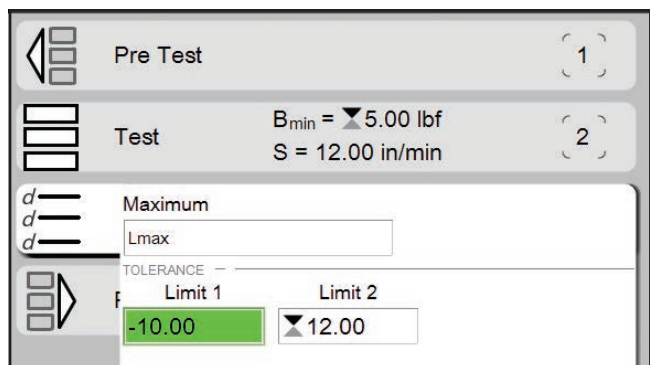

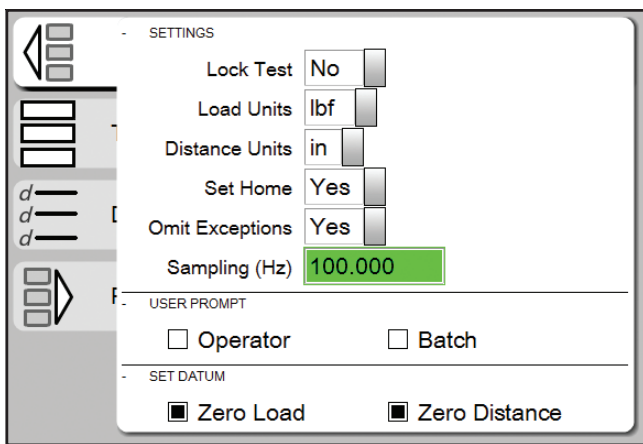

The L1 System includes a set of common force measurement test templates. The templates have a common format consisting of these four test setup stages.

- Pre Test
- Test
- Data
- Post Test

TEST SETUP ARCHITECTURE

All test setups include four common, easy-to-understand, menu-guided stages: Pre Test, Test, Data and Post Test.

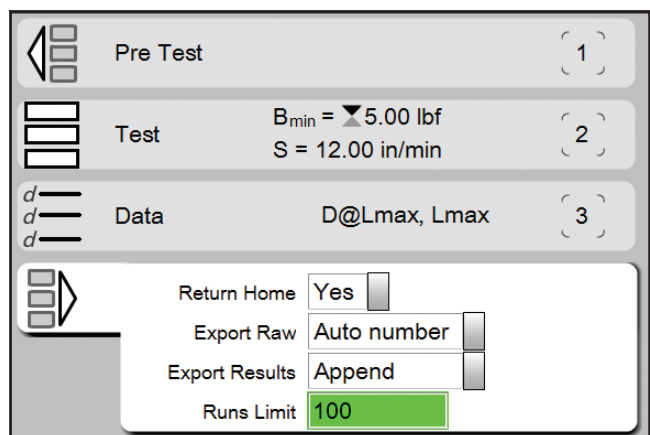

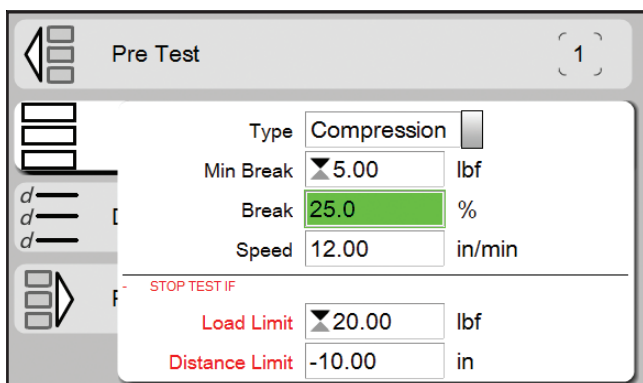

PRE TEST STAGE

The Pre Test stage supplies options you would perform prior to testing, for example, specifying the units needed to measure load and distance.

DATA STAGE

The Data stage is where you specify what results you want. For example, you can select Maximum Load, Distance @ Maximum Load, Distance @ Load Limit, Load @ Distance Limit and more. A list of values is displayed and you simply select the result you want. The Data stage is also where you can utilize tolerance limits for immediate "Pass/Fail" identification.

TEST STAGE

The Test stage is where you specify your testing requirements- what load you are using, what distance your crosshead will move, how fast your test speed is. Plus, you can easily add "exceptions". Exceptions are events that can be used to automatically stop your test, if they occur.

POST TEST STAGE

The Post Test stage lets you define what you want to do when the test concludes. You can export raw data or just the results and send to a network server. You can easily export directly to Microsoft® Excel® for custom report generation or analysis. Export information is saved as a .csv format for easy integration.

L1 SOFTWARE

When your L1 test method concludes, you can see the results you specified in your setup. Your L1 System will display results in these formats:

- Results View
- Graph View
- Data View
- Tolerance View
- Statistics View

RESULTS VIEW

Your results are displayed in a large, easy-to-read format organized for quick interpretation. The result and associated units of measure are displayed. During testing the active load and distance measurement is displayed. The crosshead speed and direction of travel is also displayed so the operator is aware of the current test status.

GRAPH VIEW

Load, Distance and Time can be used to view the data points used for your test. You may sample at rates up to 1000Hz and display your graph profile for your test. You can select a point on the graph and see the associated load, distance and time. You can also overlay multiple graphs to make graphical comparisons.

Your Test Name is displayed as well as the type of test: compression or tension.

DATA VIEW

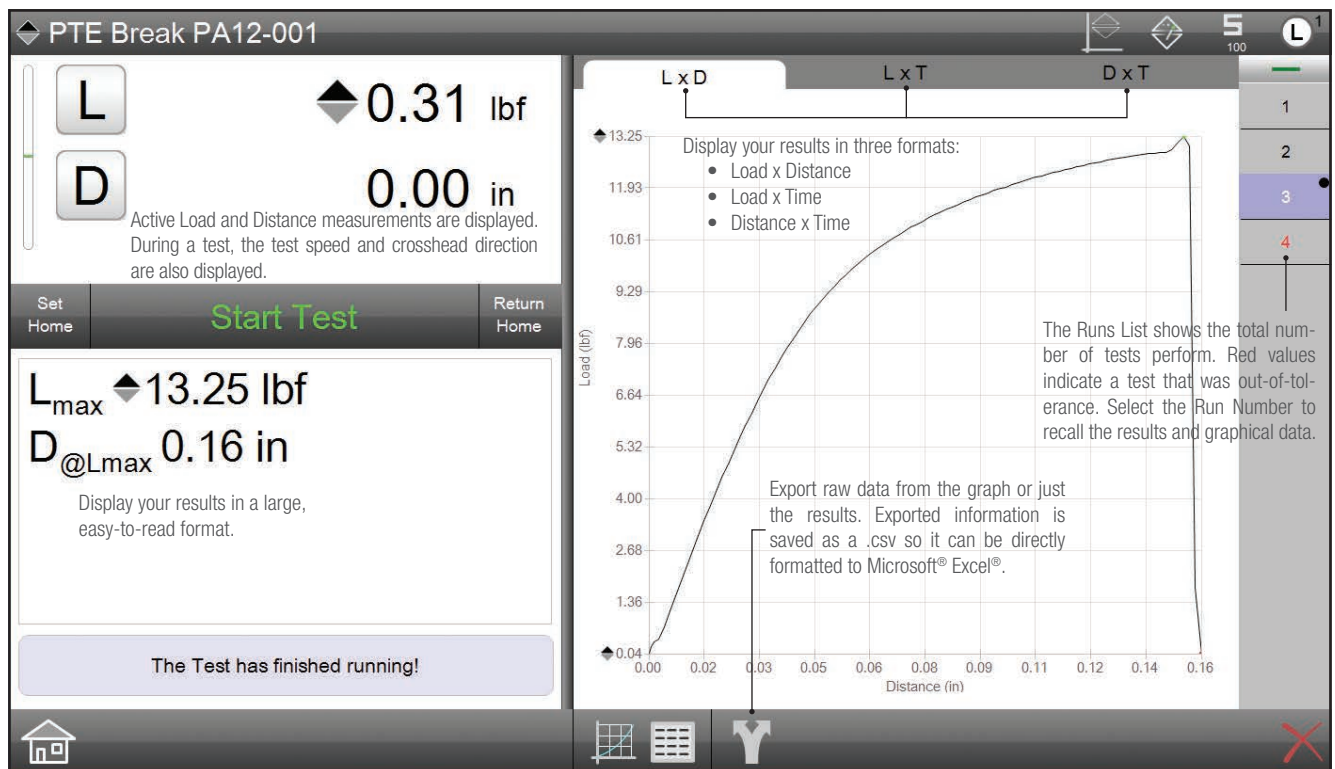

Results can be displayed in a tabular format. This is ideal for a quick comparison of each test in a batch of tests performed throughout the shift or day. You can export directly from the Data view to Microsoft® Excel®.

TOLERANCE VIEW

When tolerance limits are used for "Pass/Fail" analysis, you can see your tolerance limits compared to actual results. You also see "Pass" or "Fail". Failed results are displayed in red text. And we supply a deviation bar graph that shows where your results measured compared to your tolerance limits.

STATISTICS VIEW

Common statistics such as mean, maximum, minimum, standard deviation and six sigma may be displayed for all test results.

When the test concludes, your L1 software shows your results in numerical and graphical formats. Essential measurements are displayed in easy-to-interpret formats. You can Start and Stop a test using the touchscreen display; manually set the home position and return the crosshead to home position, and zero your load (L) and distance (D) measurements.

Compare the graphical results of multiple tests that you select. Individual graphs are color-coded and referenced to the test in the Runs List. You can also retrieve archived tests for making a graphical comparison. For example, you can compare a "benchmark" result from a year ago to a current result.

◆ PTE Break PA12-001

L 0.31 lbf
D 0.00 in

Start Test

L_{max} ◆ 15.65 lbf
D@L_{max} 4.35 in

The Test has finished running!

Run	Coef	Units	Actual	Limit 1	Limit 2	Deviation	P/F
1	Lmax	lbf	◆ 12.87	◆ 10.00	◆ 15.00	↔	Pass
1	D@Lmax	in	3.19				
2	Lmax	lbf	◆ 12.97	◆ 10.00	◆ 15.00	↔	Pass
2	D@Lmax	in	3.10				
3	Lmax	lbf	◆ 13.25	◆ 10.00	◆ 15.00	↔	Pass
3	D@Lmax	in	0.16				
4	Lmax	lbf	◆ 15.65	◆ 10.00	◆ 15.00	→	Fail
4	D@Lmax	in	4.35				

"Pass" and "Fail" status is immediate when using tolerances. Out-of-tolerance results are displayed in red.

Select the Data view and view results in a tabular format. Easily switch to Graph view by selecting the Graph symbol.

Display results in a tabular format complete with your tolerance limits. Test results that are out-of-tolerance are prominently displayed in red. Out-of-tolerance results are identified in the table, large results view and on the graph view in the Runs List. You can also display statistics on selected test runs. Calculate and display Minimum, Maximum, Mean and Standard Deviation with a single click.

S2 SOFTWARE

When you need an easy-to-use measurement system for accurately and precisely determining spring rates, spring constants, spring lengths and other spring characteristics, Starrett S2 systems are the solution. S2 systems are ideal for high-volume production testing, quality control including incoming inspection verification and validation, and research and design engineering.

S2 systems may be used for compression and extension springs with load ratings up to 11,000 lbf (50 kN, 5000 kgf). Our simple, fill-in-the-blank test setups let you test and validate your springs in as few as three steps allowing your testing to be performed in seconds. And your test results can be viewed, graphed and reported, including the ability to export results or raw data at rates up to 1000Hz.

TEST SETUP OPTIONS

Pre-Test Options

- Units of Measurement
- User Prompts to assist operator during testing
- Spring preconditioning (Scrag and Load Set Hold for duration)

Test Options

- Measure Free Length
- One Point Limit Test (Load or Height)
- Two Point Limit Test (Load and/or Height)
- Exceptions (Abort test if an exception is met)

Data Options

- Spring Constant (One Point)
- Spring Rate (Two Point)
- Date, User, Limit Setpoints

Post-Test Options

- Export Raw Data to a file location (up to 1000 samples/second)
- Export Results (Overwrite or Append data file)

Test Methods

- Spring Constant
- Spring Rate
- Initial Tension
- Free Length
- Load @ Height/Lengths
- Single Point
- Two Point
- Multiple Points
- Height/Length @ Loads
- Scragging and Load Hold Set

S2 systems can use any FMS, FMD, MMS or MMD test frame. Shown is an S2 system using an FMS-5000 test frame.

Perform one- and two-point testing to calculate spring constant and spring rate. Calculate free length and initial tension results for compression or extension springs.

Load measurement accuracies to better than 0.1% are achieved using our IEEE 1451.4 compliant load cell sensors. Capacities range from 1N to 50kN (100 gf to 11,250 lbf).

Move to a position near the desired datum using the joystick and then press Up or Down. The stage will then move slowly in that direction until it can establish the datum.

0.000

Up Down

Cancel

An automatic datuming feature helps to ensure accurate height/extension/elongation measurements. Heights can be measured to 0.001 inch (0.025 mm).

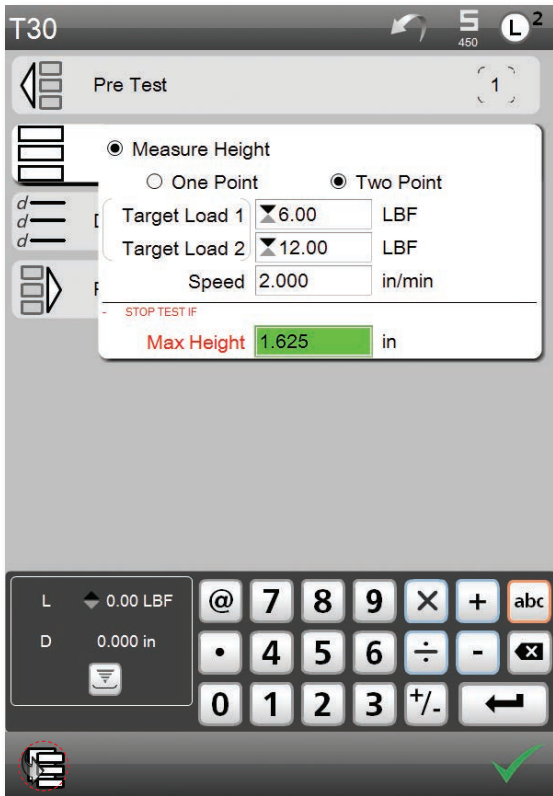

Corrections L²

Enable LEC:	No	<input type="checkbox"/>
Distance Standard:	0.000	in
Distance Observed:	0.000	in
Enable deflection compensation:	No	<input type="checkbox"/>
Deflection Distance:	0.000	in
Deflection Force:	0.000	LBF

The deflection compensation feature is ideal for compressive testing where mechanical deflection can adversely effect measurement accuracy and repeatability.

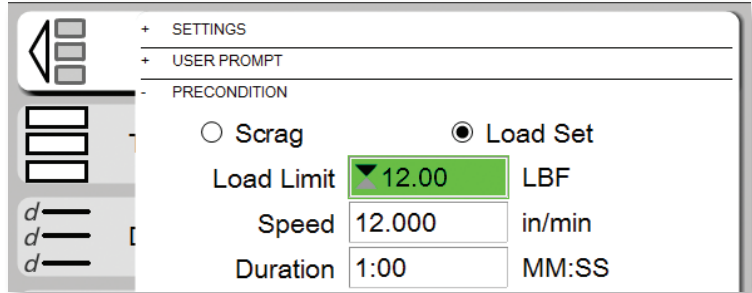

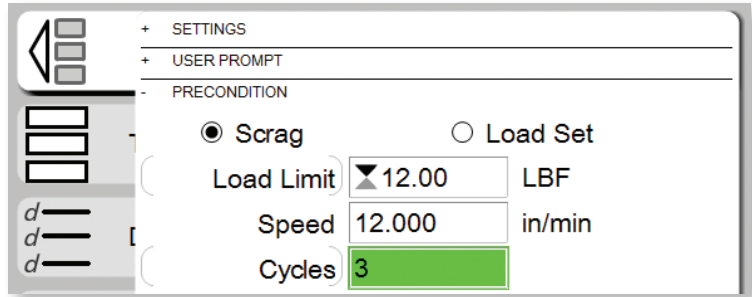

Starrett offers a complete range of testing fixtures including hooks to specialized platens that ensure proper spring alignment and parallelism during full load testing.

Create compression and extension tests using the test templates supplied standard with your S2 system. Or, use the optional Test Builder application to create sophisticated, multi-point test setups for more advanced spring measurement.

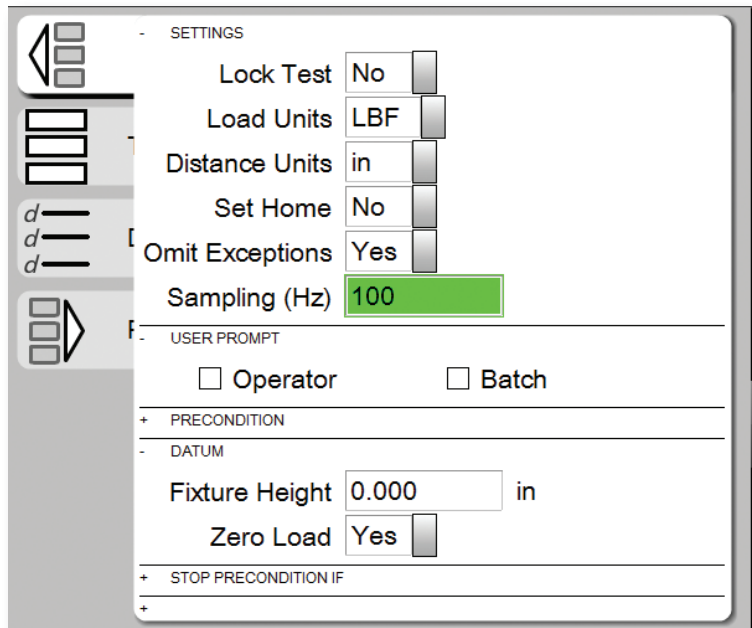

The optional S2 Automation Builder software works with the S2 Test Builder application so you can use conditional branching and digital I/O to interface with ancillary equipment such as annunciators, conveyors and turret loading devices.

Preconditioning options include scragging and load set.

(Above) You can scrag your spring based on a number of cycles or based on a time duration.

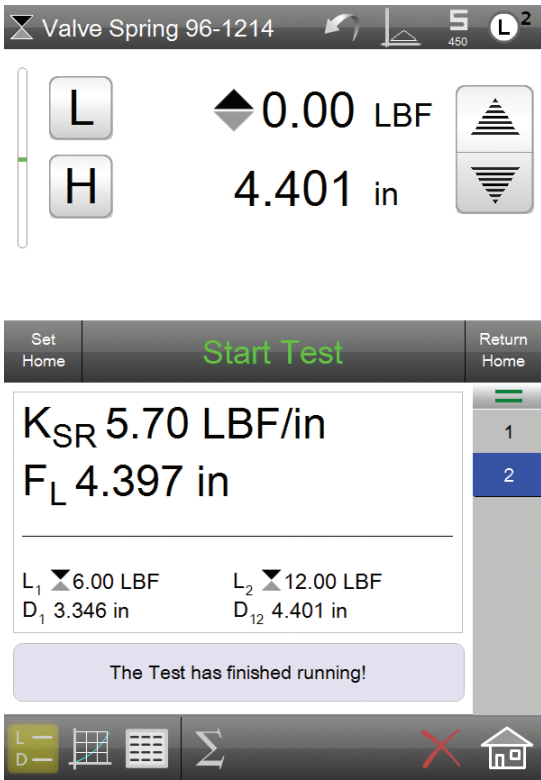

(Below) Your spring may be set solid as a preconditioning prior to your actual test procedure. For example, compress to 12 lbf and hold for 1 minute.

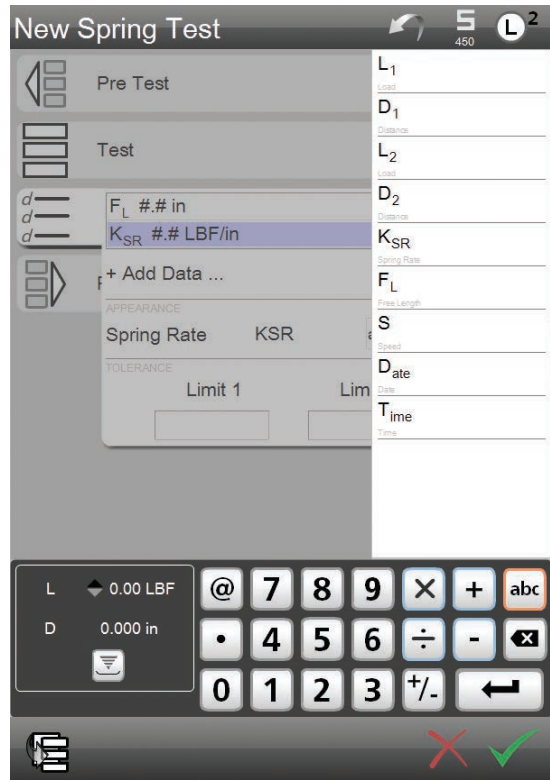

The Pre Test step lets you specify test attributes before you actually begin your testing. Set units of measure, pre-conditioning, user prompts and datum criterion.

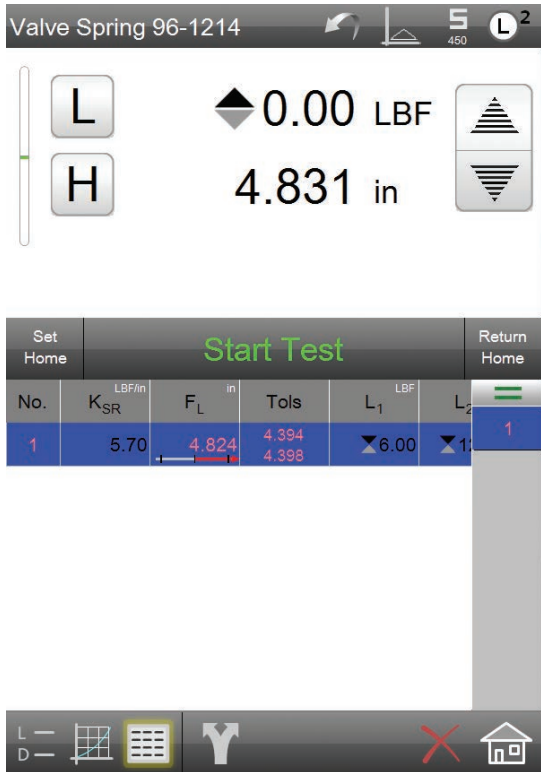

During your test, status messages display providing the operator with immediate feedback of the active step and the step's performance characteristics and current measurement. An LED on the Start/Stop push button on your test frame also indicates and active test condition.

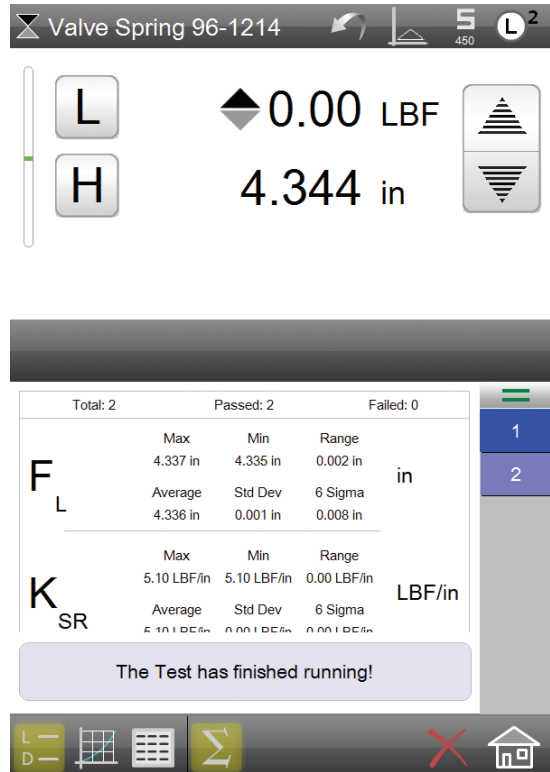

Upon completion of a test, you can display the key characteristics of your spring sample: Spring Rate, Free Length, and the individual measured results at your specified setpoint limits. The above display is for a 2-point compressive spring test.

Using the spring test setup templates, you can select the results you want using the Data step. A list of available standard results are displayed and you select the result you want and how it is to be formatted on your result view.

Like all Lx systems, within your S2 test, you may establish a tolerance on any result. Shown is an "out-of-tolerance" results for free length. The tolerance range is created between 4.394" and 4.398" in this example.

Your S2 software supports basic statistical process control. Individual results reported for your test can be compared statistically. You can view Mean, Min, Standard Deviation and Six Sigma for your selected results. When tolerance limits are used, you can summarize "pass and fail" results.

S1 SOFTWARE

ECONOMICAL DIGITAL SPRING TESTING.

Starrett S1 systems represent our most basic digital testing solution for compression and extension springs. S1 systems are ideal for high-volume production testing and individuals looking for more consistent testing results over manual testing methods.

Two types of test methods are supplied for compression and extension springs. Easy-to-use test templates let you create your test setup in seconds. The small footprint make S1 systems ideal for lean manufacturing environments or in-situ production locations.

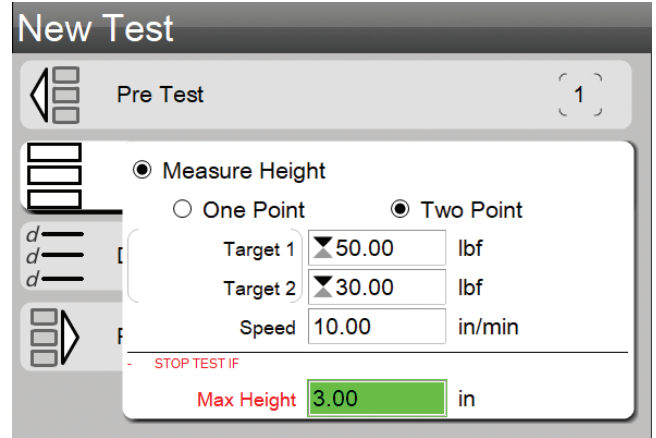

With the S1 system, you can measure:

- Spring rate
- Spring constant
- Free length
- Solid Height
- Initial tension

Make use of tolerances to determine immediate "Pass/fail" results. View results graphically or in tabular formats. You can also print out custom reports and export data to Microsoft Excel or SPC software such as ProLink's QC CALC application.

SOFTWARE FEATURES

- Use preconditioning options to exercise your spring prior to testing. You can scrag for a number of cycles or duration. You can also compress to a load set and hold for a duration.
- Single or dual limit tests may be used. You may specify a target load or target height/length to determine spring rate, spring constant, load and length at target limits, initial tension and measured free length.
- The Statistics View displays key statistical information for your batch including mean, range, standard deviations and tolerance results.

Test templates make test setup simple and fast. One- and two-point methods may be used. Measure free length by selecting the combo button. Test targets may be load- or height-based.

End	Error = No	9
Data	Lmax, D@lmax, T@lmax	10
Post Test		11

Starrett Lx systems can be interfaced with ancillary instrumentation for factory automation applications or where more advanced and complex measurements are necessary.

The optional Automation Builder software packages can be used for interfacing with instrumentation and equipment through digital and analog I/O signals.

Push I_{line} = Line 3
L_{level} = High 5

Condition Formula

Tol Lmax

! = == 7 8 9 + - ✕

< <= 4 5 6 ✕ ÷ ^

> >= 1 2 3 () abs

|| && +/- 0 • Sqrt Log Ln

! Tol Sin Cos Tan ←

(Above) A conditional branching occurs when the Lmax result is out-of-tolerance. This will cause a message to display to the operator and it will cause a signal annunciator to light red for a failed test sample.

Else 7

Condition Test Fail

Output Line Line 4

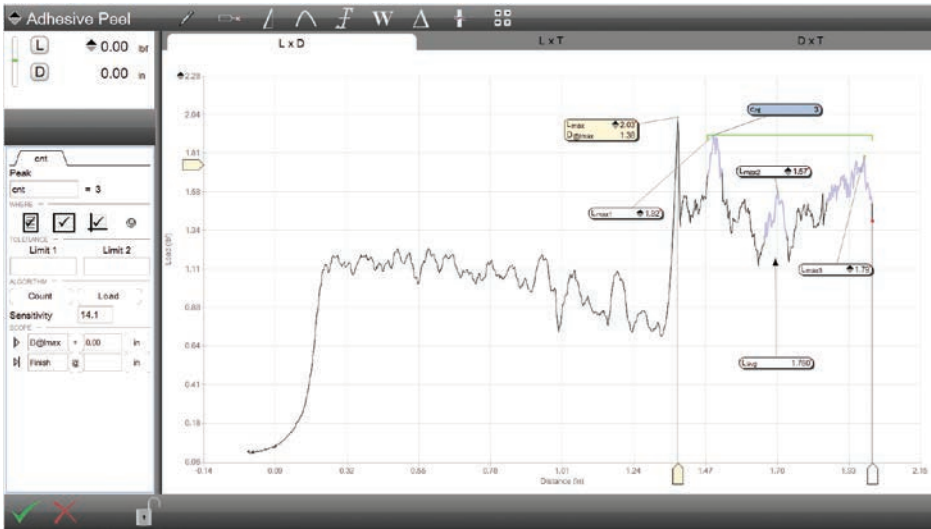

Line State High

The Automation Builder can also be used to incorporate conditional logic within your test setup. Conditional logic can be used to establish If/Else relationships, including the ability to automatically adjust test setup functionality based on events that occur during a test run.

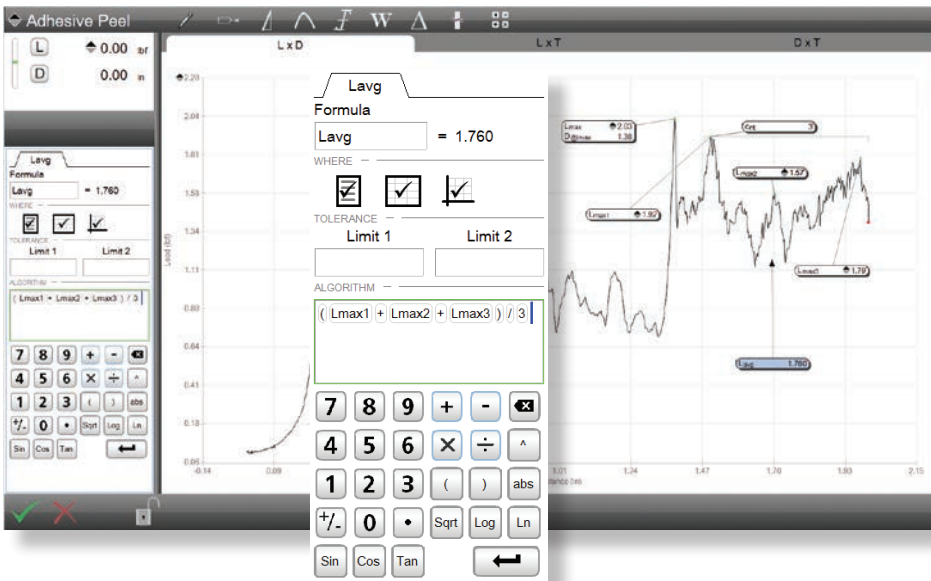

Digital I/O can be used for contact closure testing. You can measure and determine the precise load that caused the "make" or "break" in an electronic component or switch. You may also use conditional logic combined with the digital outputs to light an annunciator based on a tolerance result, or control devices like rotary tables.

The Formula Builder allows you to construct complex, derived results using arithmetic, trigonometric and logarithmic expressions. The Formula Builder is standard in L3 systems and optional for L2 Plus, L2 and S2 systems. The Formula Builder for L2 and S2 systems supports basic arithmetic functions only- add, subtract, multiply and divide.

This example shows a full graph view of an adhesive test. Three peaks are identified based on the sensitivity of 14.1 after the Lmax (maximum peak). The qualified peaks are highlighted in blue and identified as Lmax1, Lmax2 and Lmax3.

Using the Formula Builder, an expression was created that is an average of the three Lmax values only. The Lavg in this example application does not average all data points, but only the Lmax values. The formula you create is evaluated real-time. Syntax errors are noted by displaying a red line around the formula input box. If the formula is correct, the line is green.

The functions and features available using the optional Automation Builder software are shown in the table.

The Formula Builder is supplied standard on L3 systems only.

Advanced mathematical expressions are not available with the Formula Builder in the L2 and S2 system's optional Automation Builder application.

Automation Builder Software Option

Measurement Capabilities	L3	L2 Plus	L2	S2
Use Digital I/O	○	○	○	○
Use Analog I/O (requires MMx test frames)	○	○	○	○
Use Command and Conditional Logic	○	○	○	○
Formula Builder				
Create Basic Expressions using Add, Subtract, Multiple and Divide	Std ¹	○	○	○
Create Mathematical Expressions using Algebraic, Trigonometric and Logarithmic functions	Std ¹	○		

Notes: (1) The Formula Builder function is supplied standard on L3 systems only. The Formula Builder is included in the optional Automation Builder software for L2 Plus, L2 and S2 systems. Advanced mathematical expressions using algebraic, trigonometric and logarithmic functions are available on L3 and L2 Plus systems only.

DIGITAL FORCE CONTROLLER

FOR ADVANCED AND BASIC TESTING APPLICATIONS

Starrett digital force gages can be used as handheld force gages for basic applications or as a force sensor when used with a FMM Digital Force Tester, MTL and MTH Manual Tester. Listed are the various test methods that can be performed:

- **Limit Testing** - Use load, distance or a break condition and report results at the limit including maximum load and distance at maximum load.
- **Load Average Testing** - The load average test measures the load from the start and end of a test sequence.
- **Time Average Testing** - Set a time duration for a test. When load is measured at the start of the test, the test concludes at the end of the time duration. Average load is measured.
- **Cyclic Count Testing** - Define the number of cycles, up to 99,999 to be completed.
- **Cyclic Duration Testing** - Define the duration of cycles, up to 27 hours to be completed.
- **Constant Hold Testing** - Hold at a distance or load for creep and relaxation results. The maximum duration is 27 hours.
- **Contact Closure/Switch Testing** - Uses the DFC force gage to signal when an electronic switch is opened or closed as load is applied or removed.

Comprehensive Results

At the completion of your test, the DFC will display load and distance results. These can be saved to memory or exported for reporting.

DFC DIGITAL FORCE CONTROLLER

The DFC is a revolutionary concept for force measurement using a handheld force gage. The DFC may be used as a high-accuracy handheld force gage or as a digital controller for use with the FMM Digital Force Testers. The DFC can serve as a universal interface where you set up your tests and where you configure load limits, distance limits, break limits, crosshead travel direction, crosshead speed and more. The DFC features a measurement accuracy of 0.1% full scale with internal data sampling at 25kHz. Display resolution is 10,000:1. The DFC features Bluetooth®, USB and RS-232 communications plus digital I/O.

CAPACITY: 50 kN	OUTPUT: 4.227 mV/V

LOAD CELL SENSORS

LOAD CELL SENSORS

Starrett offers a full range of precision load cell sensors for material testing, force analysis and force measurement applications. Starrett load cells are compliant with IEEE 1451.4 and meet or exceed ASTM E4, BS 1610, ISO 7500-1 and EN 10002-2.

Measurement accuracies of $\pm 0.05\%$ of reading down to 1/100 of sensor capacity may be achieved. Sensors are supplied with a NIST-traceable Certificate of Calibration.

BLC LOAD CELL SENSORS

Starrett BLC load cell sensors are full-bridge, temperature compensated, strain gage instruments designed and optimized for basic force testing applications. These S-beam sensors feature high axial stiffness and minimal deflection at full capacity which leads to improved measurement accuracy.

The BLC sensors are general purpose sensors available in capacities from 2lbf to 500lbf (10 to 2500N). These sensors are used exclusively with FMM motorized test frames.

BLC - Basic Force Measurement S-beam Sensors

Model No.	Load Capacity			Safe Overload % Full Scale	Full Scale Deflection		Height		Width		Thread mm

NOTES

Load measurement accuracy is $\pm 0.1\%$ of load cell capacity. Display resolution is 10,000:1.

Starrett recommends on-site verification of accuracy during installation. Sensor calibration should be performed at least annually.

MLC LOAD CELL SENSORS

The Starrett MLC load cell sensors are full-bridge, temperature compensated, strain gage instruments designed and optimized for material testing applications. These low profile sensors feature high axial stiffness and minimal deflection at full capacity which leads to improved measurement accuracy.

The MLC are general purpose sensors available in capacities from 125N to 50kN. For FMS, MMS, FMD, or MMD test frames.

MLC Series - Low Profile Sensors

NOTES

¹ Dimension includes the base adapter. These MLC sensors are supplied with the base adapter standard. Base adapters are recommended for any MLC sensor.

Load measurement accuracy is $\pm 0.05\%$ of reading down to 1/100 of load cell capacity. Display resolution is 10,000:1.

Starrett recommends on-site verification of accuracy during installation. Sensor calibration should be performed at least annually.

LOAD CELL SENSORS

FLC LOAD CELL SENSORS

Three models of s-beam load cell sensors are also available. These are all full bridge, temperature compensated strain gage instruments, designed for force measurement applications, but suitable for some material testing applications. For FMS, MMS, FMD, or MMD test frames.

PREMIUM MODELS

Ideal for low load applications, these sensors have a safe overload rating of 1000% of the sensor's load capacity.

SEALED MODELS

These models are suitable for applications in non-laboratory environments where dirt, oil, dust and debris may be present.

ECONOMY MODELS

When price is an issue, these general purpose load cell sensors are economical and suitable for most general purpose force measurement applications.

FLC-P Series - "Premium" S-beam Sensors

NOTES

Load measurement accuracy is $\pm 0.1\%$ of load cell capacity. Display resolution is 10,000:1.

Starrett recommends on-site verification of accuracy during installation. Sensor calibration should be performed at least annually.

690

PRECISION MAKES THE DIFFERENCE

EXCEED YOUR CAPABILITIES.

The Starrett FMS incorporates new performance-based capabilities and user-friendly features to help you perform critical force tests with greater accuracy and efficiency.

It can perform all of your basic force measurement tests, as well as more complex multi-stage tests to international standards.

PLATENS

PLATENS

Starrett offers a variety of standard platens for various forms of compression testing. Standard platen types are:

- Circular Platens
- Rectangular Platens
- Perforated Platens for Foam Testing
- Self-aligning Platens for Springs

Starrett platens are made of aluminum or steel. Most of our platens mount using a 15.9mm clevis and are secured with a locking ring and grip pin. We also offer threaded platens which attach using a set screw or adapter screw.

Starrett can also custom-design platens for your specific requirements and applications.

IMPORTANT

The standard clevis diameter is 15.9mm. This clevis is suitable for load capacities up to 30kN (6600lbf). Aluminium and steel platens may be used up to 20kN except where noted.

If higher capacities are required (50kN), the clevis diameter must be 31.8mm.

CIRCULAR PLATENS

These general purpose compression platens are available in aluminum or steel. They mount to a 15.9mm clevis and are secured with a locking ring and grip pin.

ALUMINUM

- For compression testing applications on soft materials
- Surface has concentric grooves
- Anodized finish
- Operating Temperatures -94° to 356°F (-70° to 180°C)

SELF-ALIGNMENT PLATENS

These specialty circular platens are ideal for compression samples that may not be parallel to the test datum. These platens are self-aligning where the platen adjusts to the sample's surfaces to ensure parallel and perpendicular axial loading. These platen may be set in a fixed position if required. They mount to a 15.9mm clevis and are secured with a locking ring and grip pin.

STEEL

- For compression testing applications where sample parallelism is a problem
- Self-aligning or fixed positioning
- Surface has smooth finished
- Phosphate coating
- Operating Temperatures -0° to 280°C (32° to 536°F)

Self-Aligning Circular Platens- Steel									
Model No.	Load Capacity			Diameter ø		Weight (each)		Clevis Type mm	Supply
	N	KGF	LBF	in	mm	lbs	kgs		
PLATEN-223S-56-1	20,000	2,000	4,500	2.2	56	3	1.3	15.9	1
PLATEN-223S-96-1	20,000	2,000	4,500	3.8	96	3.3	1.5	15.9	1
PLATEN-223S-116-1	20,000	2,000	4,500	4.6	116	4	1.8	15.9	1
PLATEN-223S-156-1	20,000	2,000	4,500	6.2	156	6.5	2.8	15.9	1
PLATEN-223S-246S-1	20,000	2,000	4,500	9.6	246	11	5	15.9	1

The maximum load for the standard 15.9mm is 20kN.

ECCENTRIC ROLLERS

ROLLER FIXTURES

Eccentric roller fixtures are self-tightening and ideal for flat samples. Starrett offers a variety of different roller fixtures with various diameters and sample thicknesses.

Eccentric rollers can be supplied with smooth, serrated and rubber surfaces.

Starrett can assist you in selecting the proper roller fixture for your sample.

OPERATION

Eccentric roller fixtures feature a design that helps ensure proper sample alignment and that promotes a correct sample break between the upper and lower test fixture. These fixtures feature an eccentric roller that holds the sample firmly in place during tensile movement.

Eccentric rollers are easy to use. The roller is held in place with a spring mechanism that lets you open and close the roller onto the sample under test. There are different sizes for different sample thicknesses. Rollers typically have a serrated face, though you may also use rubber-coated and smooth faced rollers.

TESTING STANDARDS

There are a variety of materials that can utilize eccentric roller samples. Contact your Starrett representative for more information about your specific testing method and the available test fixtures.

Model No.	Load Capacity			Roller Diameter	Clamping Width	Type

WISE-ACTION FIXTURES

VISE-ACTION FIXTURES

Starrett vise-action test fixtures tighten manually. Starrett offers a variety of different vise-action fixtures with various clamping surfaces and jaw openings.

Vise-action fixtures can be supplied with smooth, serrated diamond and rubber surfaces.

Starrett can assist you in selecting the proper vise-action fixture for your sample.

OPERATION

Vise-action test fixtures are designed for easy sample loading and alignment. Using a screw mechanism on the test fixture, you apply force against the sample being tested in order to secure the sample in place.

Starrett offers a variety of vise-action test fixtures with different capacities. We also offer a wide assortment of grip faces including smooth, serrated, v-notch, diamond and rubber.

TESTING STANDARDS

There are a variety of testing standards that can make use of a vise-action test fixture. Contact your Starrett representative for more information about your specific testing method and the available test fixtures.

WISE-ACTION FIXTURES

Vise-action test fixtures secure the sample with a pinching force. Vise-action test fixtures let you manually tighten the jaws to the sample. A variety of vise-action test fixtures are available and suited for a wide assortment of samples and applications.

Many vise-action test fixtures may be supplied with pneumatic actuators. These are ideal for high-volume testing applications offering a quick open-release capability. Please see the Pneumatic specification sheet for more information.

SMOOTH JAW

- Suitable for own further treatments
- Steel-blanks without coating

RUBBER-COATED JAW

- 1mm rubber coating (NBR)
- Nickel-plated

SERRATED JAW

- Pyramids 1.2 x 45°
- Hardened steel 58HRC
- Nickel-plated

V-NOTCH JAW

- For all kinds of round samples
- Tooth pitch 1.2mm
- Hardened steel
- Nickel-plated

WAVE JAW

- For flexible materials
- Wave 5mm
- Hardened steel 58HRC
- Nickel-plated

DIAMOND-COATED JAW

- Clamping surface coated with synthetic diamonds
- D91 (170/200 mesh)
- Nickel-plated

VISE-ACTION FIXTURES

9

ALUMINUM, ANODIZED

- For general-purpose tensile testing applications
- For fine wire, filament, string
- Order required jaw set separately
- Operating Temperatures -94° to 356°F (-70° to 180°C)

Vise-Action Fixtures

DIMENSIONS

PRECISION MAKES THE DIFFERENCE

NO CONTACT IS THE SOLUTION.

Profile360™ is an in-line, real-time, non-contact solution for continuously monitoring key profile dimensions in complex shapes such as rubber, ceramic, plastic, and wood-plastic composite extrusions, roll-formed metal profiles, and profiled wire.

WEDGE-ACTION FIXTURES

WEDGE-ACTION FIXTURES

Wedge fixtures are self-tightening. Starrett offers a variety of different wedge-action fixtures with various face types for flat and round sample dimensions.

Wedge-action fixtures can be equipped with smooth, serrated, v-notch, diamond-coated and rubber surfaces.

Starrett can assist you in selecting the proper wedge-action fixture and jaw face set for your sample.

OPERATION

Wedge-action test fixtures are designed for easy sample loading and alignment. These test fixtures apply an increasing pressure on the sample as the sample is pulled axially.

Starrett offers a variety of wedge-action test fixtures with different capacities. We also offer a wide assortment of grip faces including smooth, serrated, v-notch, diamond and rubber.

TESTING STANDARDS

There are a variety of testing standards that can make use of a wedge-action test fixture. Contact your Starrett representative for more information about your specific testing method and the available test fixtures.

WEDGE-ACTION FIXTURES

Wedge-action fixtures are ideal for production applications where fast and precise sampling loading is required. These fixtures help ensure proper sample alignment. As the applied load increases, the gripping force on the sample increases.

Some wedge-action grips can be equipped with various types of jaw faces making them ideal for flat or round samples. Jaw face sets include four jaw faces and are ordered separately unless otherwise noted.

7

STEEL, NICKEL FINISH

- For general-purpose tensile testing applications
- For small diameter samples
- Has closed back
- Jaw faces must be ordered separately
- Operating Temperatures 32° to 266°F (0° to 130°C)

DIMENSIONS

ROPE AND BOLLARD FIXTURES

ROPE FIXTURES

Starrett rope fixtures are used for testing rope, cable, filament, yarns, etc.

These fixtures are used for tensile applications. Features include a guide roller that helps prevent breakage within the test fixture.

OPERATION

Rope fixtures feature a design that helps ensure proper sample alignment and that promotes a correct sample break between the upper and lower test fixture. These fixtures feature a spool used to wrap the sample. The sample is typically wrapped around the spool 1-1/2 or 2 times depending on the strength of the material.

These rope fixtures let you position your material under test around a cylindrical spool so that force is applied directly in line with the load cell sensor.

TESTING STANDARDS

There are a variety of testing standards for rope, filament, cords, fine wires and cables. Contact your Starrett representative for more information about your specific testing method and the available test fixtures.

Rope Fixtures

BUTTON FIXTURES

BUTTON FIXTURES

The 314 Button Fixture is designed to test the tensile strength of electrical connectors such as wire connectors that are crimped on to wires with diameters of 0.8mm, 1mm, 1.2mm, 1.6mm, 2mm, 2.4mm, 3mm, 3.2mm, 4mm, 4.8mm, 5mm and 6.4mm.

OPERATION

Rotate the body of the BUTTON-314A-1 to quickly swap between different wire gages and crimp sizes. A second grip is required to hold the opposing end of the wire, popular options include ROPE or VISE series fixtures.

Button Fixture							
Part No.	Load Capacity			Material	Diameter (mmØ)	Clevis Type (mm)	Supply Each
	N	KGF	LBF				
BUTTON-314A-1	5kN	500	1,124	Steel	1-6	15.9	1

FLEXURAL FIXTURES

FLEXURAL FIXTURES

Flexural test fixtures are a relatively simple solution for determining the strength and deformation properties of materials such as wood and timber products.

Starrett can offer a variety of test fixtures and accessories for performing 3- and 4-point bend testing.

OPERATION

A beam attaches to the force testing frame, typically using a clevis adapter. In 3-point bending tests, two anvils are arranged along the beam with the sample under test residing on top of the two anvils. Force is applied in a compression direction mid-way between the two anvils for a 3-point test.

Instead of a single anvil pressing the mid-section of the sample, two anvils may be used to press down on the sample for a 4-point test.

TESTING STANDARDS

The following testing standards can be met using standard Starrett flexural testing fixtures:

- ASTM D143
- ASTM D1037
- ASTM D3037
- ISO 3133

Additional testing standards are supported. Contact your Starrett representative for more information.

BEND 3

ALUMINUM

- For general-purpose 3-point bend testing applications
- Active Span Length is 4-150mm
- Replaceable Top and Bottom Radii for 4- and 5-point applications
- Aluminum bar with anodized finish, Hardened Steel radii
- Operating Temperatures 32° to 158°F (0° to 70°C)

PEEL FIXTURES

PEEL FIXTURES

Starrett has a wide selection of test fixtures suitable for determining adhesive strength on a variety of components from adhesive tapes, thin film coatings, copper runners on electronic circuit boards and more.

OPERATION

Peel testing fixtures come in a variety of styles that match the material under test. Some include a moving table connected to the test frame's crosshead using a cable mechanism. As the crosshead moves upwards, the cables pull the table laterally to maintain a required angle. This provides a measuring of bond strength.

Other test fixtures are application specific such as a climbing drum test fixture often used in paper and paper product adhesive testing.

TESTING STANDARDS

The following testing standards can be met using standard Starrett peel testing fixtures:

- ASTM D1781
- DIN 53295
- DIN 53494
- ISO 10373

Additional testing standards are supported. Contact your Starrett representative for more information.

PEEL FIXTURES

Ideal for adhesive testing applications or general peel testing on films, paper, foils and more. Use for 90° peel and bond strength testing methods.

The sliding table ensures a steady movement and constant peel angle so that the peel point remains in the center.

PEEL-50

STEEL, NICKEL FINISH

- For general-purpose peel and adhesive bond testing applications
- Fixed and adjustable angle platforms
- Operating Temperatures 32° to 158°F (0° to 70°C)

Shown: PEEL-50MS-1 model with adjustable angle platform.

DIMENSIONS

PEEL FIXTURES

The Climbing Drum fixture consists of a drum assembly, flexible loading straps mounted at the bottom of the stand, an upper self-closing clamp to grip the specimen and a drum clamp to hold the outer skin against the face of the drum.

During a test, the loading straps pull on the drum assembly, forcing it to rotate and climb along the length of the aluminum panel. This motion peels the outer skin away from the core structure. The peel force is measured indicating bond strength.

CLIMBING DRUM

PEEL FIXTURES

PEEL 3

ALUMINUM, ANODIZED FINISH

- Used to test bond strength of tape, plastic, paper films, laminated release coatings
- 90-degree peel angle testing
- Conforms to DIN 53357B, ISO 6133
- Operating Temperatures 32° to 158°F (0° to 70°C)
- Additional lower grip is required

PNEUMATIC FIXTURES

PNEUMATIC FIXTURES

Starrett pneumatic test fixtures use pneumatic actuation to open and close the jaws on the test fixture. Single and dual actuation are available for most test fixtures. These fixtures may be controlled using a handswitch or foot switch and are ideal for high-volume testing application. Accessories including an air compressor, tubing, regulator and switches are available.

OPERATION

Pneumatic-actuated test fixtures are ideal for high-volume testing. Air pressure is used to open and close the test fixture's jaws. The opening or closing of the jaws may be done using a foot switch kit or hand switch kit.

TESTING STANDARDS

There are a variety of testing standards that can be used with pneumatic-actuated test fixtures. Contact your Starrett representative for more information about your specific testing method and the available test fixtures.

SMOOTH JAW

- Suitable for own further treatments
- Steel-blanks without coating

RUBBER-COATED JAW

- 1mm rubber coating (NBR)
- Nickel-plated

SERRATED JAW

- Pyramids 1.2 x 45°
- Hardened steel 58HRC
- Nickel-plated

V-NOTCH JAW

- For all kinds of round samples
- Tooth pitch 1.2 mm
- Hardened steel
- Nickel-plated

WAVE JAW

- For flexible materials
- Wave 5mm
- Hardened steel 58HRC
- Nickel-plated

DIAMOND-COATED JAW

- Clamping surface coated with synthetic diamonds
- D91 (170/200 mesh)
- Nickel-plated

PNEUMATIC FIXTURES

240GP

ALUMINUM, ANODIZED

- For general-purpose tensile testing applications
- Self-aligning, self-tightening
- Order required jaw set separately
- Operating Temperatures 32° to 158°F (0° to 70°C)

PNEUM-2051	Two (2ea) pneumatic foot switches, tubes and fittings, Non locking: The jaws of the grip open by pressing, the foot pedal and close after removing, the foot from the pedal. Includes 1 pair of pedals, tubes, and fittings	1
PNEUM-2052	Two (2ea) pneumatic foot switches, tubes and fittings, Locking function: The jaws open and remain, opened after removing the foot from the pedal. The jaws close by pressing one more time. Includes 1 pair of pedals, tubes, and fittings	1
PNEUM-205PR	Pressure regulator, To adjust air pressure 1-10 bar (14.5-145 psi), Optional for PNEUM-205-1 and PNEUM-205-2	1
PNEUM-2053	Pneumatic hand switches tubes and fittings, With locking function: Handle with 2 positions. The jaws close by pulling the handle and remain closed. The jaws open by pushing the handle back. Includes 1 unit, tubes, and fittings	1
PNEUM-205F	One (1ea) extra set fittings and tubes (1 Set is already included if you order PNEUM-205-1 or PNEUM-205-2 or PNEUM-205-3)	1

A Starrett spring test fixture is shown in a laboratory setting. The fixture is a tall, vertical, black metal frame with a central column. A horizontal crossbar is positioned in the middle of the frame, with the brand name "Starrett" printed in red on its front face. Below the crossbar, a vertical rod supports a coiled metal spring. The spring is attached to a base plate at the bottom of the frame. The entire fixture is mounted on a black base with four leveling feet. On the left side of the base, there is a control panel with a red emergency stop button and a yellow start button. On the right side, there is a small control panel with a black button and a power switch. The background shows a laboratory with glass windows and various pieces of equipment.

Starrett

SPRING TEST FIXTURES

SPRING TEST FIXTURES

Starrett offers custom solutions for testing compression and extension springs. These test fixtures ensure correct axial alignment and promote accurate testing and measurements of spring constants, initial tension, free length and more.

OPERATION

Starrett can supply a variety of test fixtures for testing compression and extension springs. Generally, fixtures include hooks for extension springs and various forms of custom-made test fixtures for compression springs.

TESTING STANDARDS

There are a variety of testing methods for springs and washers. Contact your Starrett representative for more information about your specific testing method and the available test fixtures.

SPRING

STEEL, NICKEL FINISH

- For general-purpose spring testing applications
- Springs are positioned over the center rod to ensure proper alignment during compression
- Operating Temperatures 32° to 158°F (0° to 70°C)

Shown: Custom made testing fixtures for compression springs having different free lengths.

DIMENSIONS

SYRINGE TEST FIXTURES

SYRINGE TEST FIXTURES

These specialized test fixtures are designed to test medical syringes. The fixture secures the syringe tube while the plunger is moved in both compressive and tensile directions. Test fixtures are available for 5mL, 10mL and 20mL size syringes.

Other sizes available upon request. The fixture design makes loading and unloading the syringe quick and easy.

SPRING

STEEL, NICKEL COATED

- For tensile and compression testing of medical syringes
- Includes three inserts: 5mL, 10mL and 20mL
- Operating Temperatures 32° to 158°F (0° to 70°C)

DIMENSIONS

SCISSOR FIXTURES

SCISSOR FIXTURES

Scissor test fixtures secure the sample with a pinching force. The rate of clamping force changes depending on the jaw opening width. These are ideal for high-volume testing applications and are self-aligning and self-tightening.

OPERATION

Scissor test fixtures are self-tightening and self-aligning. The initial gripping force is supplied by spring tension. The clamping force to tensile force changes according to the jaw opening width. The larger the width, the more clamping force is applied.

TESTING STANDARDS

There are a variety of testing standards that may be used with scissor test fixtures. Contact your Starrett representative for more information about your specific testing method and the available test fixtures.

PRECISION MAKES THE DIFFERENCE

**YOU'VE HEARD OF THE
MOTHER OF INVENTION**

**NOW MEET THE FATHER
OF INNOVATION**

The L.S. Starrett Company was founded by Laroy Sunderland Starrett in 1880 who had patented the first combination square in 1878. Since then, we've been following in his footsteps, creating the kind of precision tools, gages and instruments that have made the name "Starrett" synonymous with "innovation." Laroy Starrett set very high standards and we steadfastly maintain them today.

FOOD TEXTURE FIXTURES

FOOD TEXTURE ANALYSIS FIXTURES

Starrett can supply a variety of testing fixtures for food texture testing applications. Shear, brittleness, softness, crispness are all qualities that can be measured using Starrett test fixtures.

All fixtures are made of corrosion resistant and durable materials.

OPERATION

Various food products are tested for properties such as shear strength, brittleness, crispness, ripeness and more. Using these test fixtures, users can assess the food product's characteristics relative to how food changes physical state during consumption- chewing, shearing, tearing.

TESTING STANDARDS

There are a variety of testing standards for different types of food products from solid and semi-solid items to baked goods, meats, dairy products, confectioneries, pastas and more. Contact your Starrett representative for more information about your specific testing method and the available test fixtures.

HOOK ADAPTERS

CLEVIS HOOKS

Clevis hooks feature a 15.9mm clevis for mounting to a standard Starrett clevis adapter. These hooks have a locking nut so you can rotate and position the hook for proper axial alignment. Hooks are available in a variety of sizes. Steel construction.

CLEVIS HOOKS

CLEVIS ADAPTERS

CLEVIS ADAPTERS

Clevis adapters are used to secure most of the testing fixtures available for your Starrett systems.

Clevis adapters are available in two diameters: 15.9mm and 31.8mm. The 15.9mm adapters are the most commonly used and are designed for load capacities below 20kN. Loads over 20kN will typically use the 31.8mm clevis.

Special clevis adapters are available for use with Starrett force gages. These adapters thread on to the force gage shaft and allow clevis-style test fixtures to be utilized.

CLEVIS ADAPTER SET

PRECISION MAKES THE DIFFERENCE

HIGH PRODUCTIVITY AND LONGER LIFE

For cutting hard materials!

The Advanz™ MC5 utilizes a multiple chip grind with a high/low tooth sequence. The chip load is spread out over more teeth to facilitate longer life.

FORCE GAGE ADAPTERS

FORCE GAGE ADAPTERS

These adapters are supplied standard with Starrett force gages. They may also be used with thread adapters and various load cell sensors available from Starrett.

Gage adapters include flats, notches, chisels, points and rods.

FLAT ADAPTERS

- For general-purpose compression testing applications
- Threaded attachment
- Operating Temperatures 32° to 158°F (0° to 70°C)

Flat Adapters											
Model No.	Load Capacity			Thread Size Metric	Material	Diameter (Flat)		Length		Supply	OD
	N	KGf	LBF			in	mm	in	mm		
MLX-FLAT-A	20	2	5	M6 x 1-6H	Aluminum	0.5	12	0.5	12	1	1/2"
MLX-FLAT-S	1,500	150	330	M6 x 1-6H	Stainless	0.5	12	0.5	12	1	1/2"

MLX-FLAT-XL	5,000	500	1,100	M12 x 1.75-6H	Stainless	0.75	19	0.875	22	1	3/4"

NOTCH ADAPTERS

- For general-purpose compression testing applications
- Threaded attachment, 90° notch
- Operating Temperatures 32° to 158°F (0° to 70°C)

V-Notch Adapters											
Model No.	Load Capacity			Thread Size Metric	Material	Diameter		Length		Supply	OD
	N	KGf	LBF			in	mm	in	mm		
MLX-NOTCH-A	20	2	5	M6 x 1-6H	Aluminum	0.375	9.5	0.625	15.9	1	3/8"

EXTENSION RODS

These threaded extension rods come in a variety of lengths and materials. Use to affix gage adapters or other forms of threaded test fixtures.

Rods can be threaded to a force gage or load cell sensor.

EXTENSION RODS

- Provides for a longer testing length
- Threaded attachment, multiple lengths available
- Operating Temperatures 32° to 158°F (0° to 70°C)

Extension Rods

FORCE GAGE ACCESSORY KITS

These force gage kits include a hook, flat, notch, chisel, point and rod.

FORCE GAGE KITS

- Includes each force gage accessory by type
- Threaded attachment
- Operating Temperatures 32° to 158°F (0° to 70°C)

Force Gage Accessory Kits

THREADED ADAPTERS

These threaded adapters are used to mate dissimilar threaded connectors. Included are couplers, male-to-male and male-to-female thread adapters.

COUPLERS

- For mating two male threaded adapters
- Threaded attachment
- Operating Temperatures 32° to 158°F (0° to 70°C)

Female to Female Threaded Couplers

Model No.	Dimensions			Supply
	Length	Thread A	Thread B

CABLES

CABLES

Listed below are the cables used with all Starrett force gages and Lx systems.

Systems using L1, L2, S2, L2 Plus and L3 software interface and communicate with their associated computer using USB communications.

The DFG and DFC force gages use a USB cable for charging the internal lithium ion battery. The USB cable may also be used with communicating to a computer.

When the DFC force gage is used as a controller with the FMM test frames, communications between the DFC and the FMM using the L1-CONTROL cable.

USB CABLES

- Interface cable between the Starrett test frame and the personal computer operating L1, L2, S2, L2 Plus and L3 software.
- Interface cable between Starrett force gage and a personal computer.
- Cable used for charging the Starrett force gage internal battery.

USB Cables							
Model No.	Interface Between Devices	Type	Connector		Length		Supply
			A	B	in	mm	
L1-USB	DFC and DFG Force Gage	USB 2.0	USB-A	USB-B Micro	36	915	1
12405-0	AIO PC to FMM, FMS, MMS, FMD and MMD Test Frames	USB 2.0	USB-A	USB-B	72	1,830	1

Shown: DFC force gage shown with L1-USB cable. Cable is supplied standard.

L1-CONTROL CABLE

- Interface cable between the DFC force gage and the FMM test frame.
- Bi-directional control
- Charges the DFC force gage when connected to a powered FMM test frame.

D-Sub Style Cables							
Model No.	Interface Between Devices	Type	Connector		Length		Supply
			A	B	in	mm	
L1-CONTROL	DFC Gage to FMM Test Frame	D-sub	9 Pin Female	9 Pin Male	74	1,880	1

L1-RS232 CABLE

- Interface cable between the FMM test frame and a device using RS-232

D-Sub Style Cables							
Model No.	Interface Between Devices	Type	Connector		Length		Supply
			A	B	in	mm	
L1-RS232	FMM Test Frame to RS-232 Device	D-sub	9 Pin Female	9 Pin Female	74	1,880	1

**GAGE ADAPTER PLATES AND
MOUNTING BLOCKS**

ADAPTER PLATES

These adapter plates are used with non-Starrett digital force gages. They allow some competitive force gages to be used with Starrett test frames. Please consult with your Starrett representative before ordering to ensure these plates are compatible with your non-Starrett force gage.

FORCE GAGE ADAPTER PLATES

- Includes mounting block
- Ensures proper alignment on a Starrett test frame

Gage Adapter Plates			
Model No.	Use with this brand Force Gage	Model Type	Supply
MLX-FG-CHAT	Chatillon	DFX, DFE, DFS, DFE2, DFS2	1
MLX-FG-IMAD	Imada	ZT, DS2	1
MLX-FG-MARK	Mark-10	Series 7, 5, 4	1
MLX-FG-MECM	Mecmesin	AFG, BFG	1
MLX-FG-SHIM	Shimpo	FG-7000, FGV-XY, FGE	1

Chatillon® adapter plate

Mark-10® adapter plate

MOUNTING BLOCKS

These mounting blocks are used with the FMM model test frames. They are used with the BLC Load Cell sensors and the DFG and DFC force gages.

The mounting blocks ensure correct alignment and proper axial positioning.

MOUNTING BLOCKS

- For Starrett Force Gages and BLC Load Cells
- Ensures proper alignment on a Starrett FMM test frame
- Includes all mounting hardware

BLC adapter plate

DFG and DFC adapter plate

Mounting Blocks		
Model No.	Description	Supply
SPK-FG-BLOCK	Used to mount Starrett DFC or DFG Force Gage to FMM test frame	1
SPK-BLC-BLOCK	Used to mount any BLC Load Cell Sensors to the FMM test frame	1

TESTER ACCESSORIES

TESTER ACCESSORIES

Starrett MTL and MTH test frames may be equipped with a digital scale for measuring distance/deflection.

Horizontal mounting legs are available that allow the MTL-110, MTL-330 or MTH-550 to be operated in a horizontal configuration.

Bench clips may be used with FMM, FMS, FMD, MMS and MMD test frames. These clips help secure the test frames permanently to their work surface.

DIGITAL SCALE FOR MTL AND MTH FRAMES

- Includes mounting block
- Ensures proper alignment on a Starrett test frame

Digital Scale		
Model No.	Model Type	Supply
MTL-SCALE-110	MTL-110, MTL-330	1
MTL-SCALE-330	MTL-330	1
MTH-SCALE-550	MTH-550	1

HORIZONTAL MOUNTING LEGS

- Use with MTL-110, MTL-330 or MTH-55
- Includes all mounting hardware

Horizontal Mounting Legs		
Model No.	Model Type	Supply
MLX-10648	MTL-110, MTL-330, MTH-550	1

DIGITAL TEST FRAME BENCH CLIPS

- Use with FMM, FMS, FMD, MMS and MMD test frames
- Includes mounting hardware

Digital Test Frame Bench Clips		
Model No.	Model Type	Supply
L1-FMMCLIP	FMM	2
12745-0	FMS, FMD, MMS, MMD	1

SAFETY SHIELDS & EXTENSOMETERS

SAFETY SHIELDS

Optional safety shields are available for all motorized test frames. On FMS, MMS, FMD, and MMD models safety shields include an interlock, prevent tests from being run when the shield is open. All shields are constructed with aluminum frames and shatter-resistant aerospace acrylic.

Safety Shields		
Model No.	Description	Interlocks
FMM-S-SHIELD	FMM Safety Shield Short	No
FMM-SHIELD	FMM Safety Shield Standard	No
FMM-X-SHIELD	FMM Safety Shield Extended	No
FMS-1000 SHIELD	Safety Shield FMS-1000	Yes
FMS-2500 SHIELD	Safety Shield for FMS-2500 & FMS-5000	Yes
MMD-SHIELD	Safety Shield for MMD & FMD Test Frames	Yes

MMD Shield

FMS Shield

FMM Shield

EXTENSOMETRY

Starrett offers a full range of contact-type extensometers. Our systems are compatible with Reliant Technologies® and Epsilon® extensometers and feature automatic identification of model and measuring range.

Starrett MMS and MMD material test frames may be used with extensometers. Starrett L3 systems may use extensometers from Reliant Technologies and Epsilon Technology Corporation.

Extensometers are customized so that they are automatically recognized by the L3 system. Selecting the Extensometer symbol will display key characteristics of the instrument including measuring range.

APPLICATIONS & SERVICES

APPLICATIONS

Adhesives

Important characteristics of adhesives, epoxies and materials that are bonded to one another can be measured using peel testing methods. Pressure-sensitive adhesive properties associated with materials such as labels, packaging products and medical wound management products, can be tested using a 180° testing method.

Building Materials

Materials used in building products, including asphalt and cement-based products can be tested to ascertain their strength and suitability under varying environmental conditions. Compressive and shear properties can be determined using L3 systems.

Ceramics

Ceramic and glass products are increasingly be used in a wide variety of products from cellular phones to fibre-optic cables. Because of their inherent brittleness, assessing their mechanical properties are important considerations, both in their design and application.

Biomedical

Testing medical devices and materials used in the production of medical devices are critical to ensure compliance to federal regulations. From the testing of latex products, syringes, stents, catheters to packaging products for medical devices, L3 systems can be used to verify and validate material compliance.

Composites

Composites are made by combining two or more materials- often materials with very different properties. Composites based on polymers continue to evolve and find their way into all kinds of products for aerospace and automotive applications to medical applications. Understanding stress and strain characteristics are critical in evaluation composites and their applicability.

Textiles

Fabric, yarn, filaments, cords and cloth are tested for strength and durability. Both natural and synthetic textiles are tested for strength and adhesion, tear strength, seam slippage and break strength.

Metals

Metals and alloys are tested under varying conditions. Tensile, compressive, shear, flexural and fracturing properties are important characteristics of all metals and alloys. Modulus, brittleness versus ductility, strength at offset yields are used to characterize these products and their ability to satisfy application and life-cycle requirements.

Plastics

The growth of plastics and polymers is exponential. Plastics are used everywhere in consumable materials to life-saving medical devices. Plastic properties are important in validating materials used in the development of products comprised of polymers. Tensile, compression, break/rupture/puncture and flexural testing are important characteristics in classifying plastics.

Rubber/Elastomers

Medical gloves, hoses used in automotive and aerospace products, foam, seals and building products are made from rubber and elastomer products. Compression strength, creep strength, puncture strength and tensile strength are important in assessing their suitability and manufacturability.

APPLICATIONS

STARRETT KNOWS FORCE ANALYSIS AND MEASUREMENT

Tensile testing

Identifying tensile force characteristics such as peak load is critical in validating a product's safety and application. Whether its consumer products, medical products, packaging materials or fasteners used in the building trades, tensile testing is a fundamental measurement available on all Lx systems.

Shear testing

Shear tests help measure the deformable mechanical properties of cosmetics, plastics, composites, fluids and other samples. Lap shear testing can be used to measure mechanical weld strength or the adhesive strength of epoxies.

Peel testing

Adhesive strength properties are measured to understand the bonding capabilities of coatings and glues on various types of materials- from paper to substrates to building materials. Both 90° and 180° testing can be performed to measure the peak holding strengths under standard test methods such as ASTM F88.

Compressive testing

Compressive loads are important in evaluating packaging designs, such as top load testing. Core sampling of concrete-based products are measured to determine their strength. And springs are analyzed under load to determine spring rate based on free length.

Flexural testing

Flexural strength and material stiffness represent the combined effects of a sample's basic tensile, compressive and shear characteristics. Composites, wood products, paper products can be tested in both 3- and 4-point methods to determine their stiffness and resilience.

Coefficient of friction testing

ASTM D1894 is a common test method for measuring coefficient of friction. Materials such as plastic sheeting can be tested to measure both the static and kinetic frictional characteristics. Other materials, such as flooring products are tested to determine their slip resistance and safety under various environmental conditions.

Break, Fracture and Rupture testing

Destructive testing can involve tensile, compressive, shear and other test methods where the product is tested to failure. Often this testing is used to determine the "peak" measurements that occur prior to the break event. Lx system allow you to measure precisely based on stress, strain, load, displacement and time.

Load rate testing

Load rate testing is a more complex testing method compared to testing to a setpoint at a specific velocity. Load rate testing can be used on consumer products, such as children's attire, to measure the pull strength of buttons and their resistance to breaking loads. Here the button is pulled at a rate (lbf/minute) rather than a time velocity (in/min).

Contact closure testing

Using the optional Automation Builder, the "make and break" load for an electrical switch can be measured precisely. Load is applied to the switch and the peak load is measured when the switch closes/opens. This type of application can be tested on keypads, membranes and other materials that utilize a resistance change.

Insertion/Extraction testing

Insertion/extraction testing is performed on electronic components like jacks, medical devices, consumer products, and more. The loads are measured in both directions- tensile and compressive to determine the sample's characterization for the application and for product life-cycle determination.

Creep and Relaxation testing

Foam is a material where its deformation while under an applied load below its yield strength is measured and analyzed. Knowing the material's ability to maintain its specified deformation is important for comfort and longevity in its intended application.

APPLICATIONS

PACKAGING TESTING

T-Peel
90° Peel
180° Peel
Solder Paste Tackiness
ASTM F1140 - Burst Strength
ASTM D2659 - Top Load
ASTM F88 - Seal Strength
EN 868-5 - Seal Strength Pouches
ASTM C633 - Adhesion Spray Coating
ASTM D1335 - Tuft Binding Floor Covering
ASTM D903 - Adhesive Bond
ASTM D1876 - Peel Resistance
ISO 36 - Rubber Adhesion
ISO 2411 - Adhesion Plastic
ISO 4587 - Lap Shear Strength
ISO 11339 - Flexible Bond Assembly
EN 1465 - Lap Shear Strength
EN 1719 - Tack Measurement
EN 1939 - Peel Adhesion
Component Testing
Compress (Load/Extension)
Compress (Stress/Strain)
Indentation (Load/Extension)
Indentation (Stress/Strain)
Spring Rate
Spring Force
Spring Height

MEDICAL DEVICE TESTING

ASTM F88 - Seal Strength
ASTM F382 - Metallic Bone Plates
ASTM F451 - Bone Cement Strength
ASTM F564 - Metallic Bone Staples
ASTM F1828 - Ureteral Stents
ASTM F1839 - Foam Devices
ASTM F1874 - Sutures Bend Test
ASTM F2079 - Stents Tensile Strength
ASTM F2132 - Puncture Resistance
ASTM F2183 - Punch Testing
ASTM F2255 - Lap Shear Testing
ASTM F2256 - Tissue Adhesives
ASTM F2258 - Tissue Adhesives
ASTM F2392 - Burst Strength Sealant
ASTM F2458 - Closure Strength
ASTM F2477 - Stents Strength
ASTM F2502 - Plates and Screws
ASTM F2516 - Tensile Nitinol Wire
ASTM F2606 - Bend Vascular Stent
ASTM D6319 - Medical Gloves
BS EN 455-2 - Medical Gloves
ISO 7886-1 - Hypodermic Syringe
ISO 14879 - Tibial Trays
ISO 11193 - Medical Glove

COMPRESSION TEST

Tensile Test

ASTM D3039 - Tensile Carbon Fiber
ASTM D3846 - Shear Strength
ASTM D7269 - Aramid Cords
ASTM D6484 - Compressive Strength
ASTM D1055 - Flex Resistance
ASTM D3574 - Indentation Deflection
ASTM D3574 - Foam Deflection
EN 14509 - Shear Strength
ISO 527-4 - Tensile Isotropic/Orthotropic
ISO 14125 - Flexural Properties
ISO 14126 - In-plane Compression
TAPPI - 404 - Tensile Break Strength
TAPPI 220 - Burst Strength
TAPPI 456 - Wet Paper Strength
TAPPI 457 - Pull to Rupture

SERVICES

CALIBRATION, FIELD SERVICE, FACTORY SERVICE

Starrett and our global network of service providers can provide all levels of service for your material test and force measurement systems. We can supply a comprehensive range of calibration and verification services to ensure that your testing meets the requirements of international testing standards. Calibrations can be performed to ASTM E4 for load and ASTM E2658 for displacement or to equivalent standards from ISO, BS, DIN and more. Speed, stress and strain verifications can be performed on-site by technicians accredited to ISO 17025.

Preventative maintenance programs, field and factory repair services are available to ensure that your systems perform to their published specifications.

Starrett can provide factory services including load cell calibrations, test frame repair and reconditioning. All Starrett load cell sensors are supplied with a NIST-traceable Certificate of Calibration.

Specialized services, including system integration with existing instrumentation, or application development for complex testing applications can be supplied by your Starrett representative.

Your Starrett representative can provide on-site training to your personnel to help ensure that your system operates to its published specification. Our training also provides your operators with the knowledge needed to perform your testing in a safe and efficient manner. Our objectives are to help you make your products better through improved resource utilization, increased throughput and optimized efficiency.

Starrett stocks critical spare parts and accessories for quick delivery. Load cell sensors and commonly used test fixtures are readily available.

Field and factory calibrations are performed by authorized Starrett service technicians to accepted industry standards and methodology. All calibrations are NIST-traceable.

FORCE AND MATERIAL TESTING TERMINOLOGY

Terms	Description
Load	Load is a common term used in place of a force exerted on a surface or a body, it is often expressed in either N (Newton, 1 kg * m/s ²), LBF (pounds force), KGF (kilograms force). On a force measurement machine load is measured with a Load Cell Sensor.
Stress	Stress is a measurement of force (load) per unit area. It is often denoted by "σ" (sigma). To calculate stress you will need to know force and area of the sample being tested. Stress is expressed in either PSI (Pounds per inch ² , lbf/in ²), KSI (Kilograms per inch ² , kg/m ²), or MPa (Mega Pascal, 1 Pascal = N/m ²).
Strain	Strain is the amount of deformation of a sample compared to the sample's original size. It is often denoted by "ε" (epsilon). Strain values are unit-less (because in the ratio the units cancel themselves out). However, it can be expressed by a percentage or referred to as "stains".
Elasticity	Elasticity is the ability of a material to return to its original shape when a load causing deformation is removed. An Elastic material will obey Hooke's Law where Stress is directly proportional to Strain. Springs are supposed to obey Hooke's Law.
Plasticity	Plasticity describes when a material tends to remain deformed even after reducing the Stress that caused the original deformation. A plastic material will retain its shape once the load causing the deformation is removed. Plasticity is closely associated with malleability where a material can be "worked" or "hammered" into a permanent shape.
Stiffness	Stiffness is the resistance of an elastic material to deformation after an applied load.
Elongation	Often associated with ductility, Elongation is the increase in gauge length divided by the original gauge length. Elongation is typically expressed as a %.
Extension	Extension is the measurement of distance, Extension is sometimes called Deflection and is expressed in either; IN (Inch), MM (millimeter), or % (percent elongation). On a force measurement machine extension can be measured with an internal encoder or using an ancillary extensometer.
Modulus of Elasticity	Also referred to as Young's Modulus. It is the rate of change of Stress as a function of Strain. It characterizes materials as a measure of their stiffness. It is calculated as the slope of the line before the proportional limit.
Proportional Limit	The highest Stress at which the curve in a Stress/Strain diagram is a straight line.
Axial Load	The load applied to the primary axis. Sensors have a "live" side, e.g. the side where load is to be applied. Incorrect loading WILL result in erroneous readings.
Full Scale Deflection	The mechanical deflection produced by the load sensor when maximum (full scale) load is applied. All load cells deflect when load is applied.
Temperature Compensation	Load cells are affected by temperature which can impact Zero Balance. Our sensors are temperature compensated. Its "good practice" to allow the load sensor to "warm up" (5 minutes) prior to use.
Capacity	The maximum axial load a load cell sensors is designed to measure within its specification.
Span	Another term used to express the sensor's maximum rated output.
Zero or Zero Balance	The signal of the load cell when no load is applied.
No Load	The condition of the load cell, when in its correct orientation, and with no load applied and no fixtures attached.
Mode	Starrett load cells will operate in Tension and Compression modes.
None-linearity	The algebraic difference between output at a specified load and the corresponding point along a straight line drawn between minimum load and maximum load. Normally expressed as %FS (Full Scale).
Hysteresis	The algebraic difference between output at a given load descending from maximum load and output at the same load ascending from minimum load.
TEDS	Short for Transducer Electronic Data Sheet, TEDS chips allow Starrett load cells to be self-identifying, this "Plug & Play" ability minimizes system setup time and stores sensor calibration data
NIST Certification	National Institute of Standards and Technology. Starrett load cells are supplied with a Certificate of Calibration traceable to NIST.
ASTM E4	AKA: American Society for Testing and Materials. E4 is the "Standard Practices for Force Verification of Testing Machines".
ASTM E83	is the "Standard Practice for Verification and Classification of Extensometer Systems". Normally, ASTM E4 is required for a Material Test System, but NOT necessary for a Force Measurement Test System.

COMMON COMPRESSION SPRING TERMINOLOGY

Symbol	Units	Description	Formula
D	mm, in	Mean diameter	$D = D_e - d$
D_e	mm, in	External diameter	$D_e = D + d$
D_i	mm, in	Internal diameter	$D_i = D - d$
d	mm, in	Wire diameter	$d = D_e - D$
E	Mpa, PSI	Modulus of elasticity	$E = \delta/\epsilon$
L1, L2	N, Lbf	Target loads (related to target heights/lengths)	
$F_c Th$	N, Lbf	Theoretical load/force at set solid	
F_n	N, Lbf	Load/force related to L_n (smaller length)	
f_e	Hz	Natural frequency	
k	-	Stress correction factor	
L_0, FL	mm, in	Free length/height	
D_1, D_2	mm, in	Target Length/distance (related to target loads)	
L_c	mm, in	Solid length	$L_c = d(n+ni+nm)$
L_d	mm, in	Length of wire	$L_d = p D [2 + nm + n / \cos(z)]$
LK	mm, in	Buckling length	
L_n	mm, in	Smallest allowed operating length (geometric)	$L_n = d (n + ni + nm) + S_a$
L_r	mm, in	Smaller allowed operating length (stress)	
M	g, lb	Mass	$M = L_d \rho \pi d^2 10^{-3} / 4$
m	mm, in	Spring pitch	$m = [L_0 - d (ni + nm)] / n$
N		Number of cycles	
n		Number of active coils	$n = G d^4 / (8 R D^3)$
ni		Coils related to the ends	
nm		Number of dead coils	
nt		Total number of coils	$nt = n + nm + 2$
R, KSR	N/mm, Lbf/in	Spring Rate	$R = G d^4 / (8 n D^3)$ or $(L_1 - L_2) / (D_1 - D_2)$
R_m	Mpa, PSI	Ultimate tensile strength	
Sh	mm, in	Spring travel	$Sh = D_1 - D_2$
W	Nmm, Joule	Stored energy	$W = 0.5(L_1 + L_2)(D_1 - D_2)$
w	-	Spring index	$w = D / d$

Closed and Squared

Closed and squared end compression springs are the most common. This end type allows the spring to stand vertically when placed on a flat surface. The last coil on either end is closed. This end type is suited for compression springs with a low slenderness ratio.

Closed and Ground

Closed and ground ended compression springs are also common but they are more expensive. Closed and ground ends will help your compression spring stand vertically straight on a flat surface when the slenderness ratio is too large.

Double Closed

Double closed ends are very similar to closed and squared ended compression springs. Instead of the spring having one closed coil at the ends, it has two. They are used to provide stability when your spring has a high slenderness ratio. This end type helps prevent buckling.

Open Ended

Open ended compression springs are uncommon since the spring will not be able to stand unless supported by a shaft or mandrel. There is a pitch between each coil on an open ended compression spring.

COMMON SPRING DESIGN MATERIALS

Material	Stress	Corrosion Resistance	Application
Brass	Low	Yes	Water resistant
Phosphor Bronze	Low	Yes	Electrical connectivity
Stainless Steel (302/304)	Low	Yes	Corrosive environments
Oil Tempered	Medium	No	Large diameters
Hard Drawn MB	Medium	No	Low cost
Music Wire	High	No	High stress

COMMON EXTENSION SPRING TERMINOLOGY

Symbol	Units	Description	Formula
A_{L0}	mm, in	Free length tolerance	
D	mm, in	Mean diameter	$D = D_e - d$
D_e	mm, in	External diameter	$D_e = D + d$
D_i	mm, in	Internal diameter	$D_i = D - d$
d	mm, in	Wire diameter	$d = D_e - D$
E,	Mpa, PSI	Modulus of elasticity	$E = \delta/\epsilon$
F0	N, Lbf	Initial tension	$P_i = 2P_1 - P_2$
L1, L2	N, Lbf	Target loads (related to target heights/lengths)	
Fc Th	N, Lbf	Theoretical load/force at set solid	
Fn	N, Lbf	Load/force related to Ln (smalled length)	
fe	Hz	Natural frequency	
k	-	Stress correction factor	
L0, FL	mm, in	Free length/height	
D1, D2	mm, in	Target Length/distance (related to target loads)	
Lc	mm, in	Solid length	$L_c = d(n+ni+nm)$
Ld	mm, in	Length of wire	$L_d = \pi D [2 + nm + n / \cos(z)]$
LK	mm, in	Buckling length	
Ln	mm, in	Smallest allowed operating length (geomometric)	$L_n = d(n + ni + nm) + S_a$
Lr	mm, in	Smalled allowed operating length (stress)	
M	g, lb	Mass	$M = Ld \pi d^2 10^{-3} / 4$
m	mm, in	Spring pitch	$m = [L_0 - d(ni + nm)] / n$
N		Number of cycles	
n		Number of active coils	$n = G d^4 / (8 R D^3)$
ni		Coils related to the ends	
nm		Number of dead coils	
nt		Total number of coils	$nt = n + nm + 2$
R, KSR	N/mm, Lbf/in	Spring Rate	$R = G d^4 / (8 n D^3)$ or $(L_1 - L_2) / (D_1 - D_2)$
Rm	Mpa, PSI	Ultimate tensile strength	
Sh	mm, in	Spring travel	$Sh = D_1 - D_2$
W	Nmm, Joule	Stored energy	$W = 0.5(L_1 + L_2)(D_1 - D_2)$
w	-	Spring index	$w = D / d$

Hooks and Loops

Extension springs make use of hooks or loops. Loops are closed while hooks have an open side or section.

No Hooks

These types of ends have o stress or fatigue on the ends of the extension spring. The amount of pulling force and distance increases and the life cycles re longer. No hooks have the ability to use a bolt to thread into the inner diameter of the extension or tension spring thus securing the ends of the spring

Machine Hook and Loop

Machine hooks are a common type of extension spring hook. These hooks are stronger than cross over center hooks because the radius of the bend to make the hook is not as pronounced.

Crossover Center Hooks

Crossover center type extension springs are very common. This type of hooks is made by lifting the last coil and twisting the coil towards the middle therefore crossing the center.

Extended Hooks

Extended hook extension springs are very useful when you need a long length inside hooks but a short body length to get more force out of the spring through less coils. It is the most expensive hook type.

Side Hooks

This hook type is used when the body of the spring must not interfere with the components of a mechanism. This is due to the fact that the hooks are on one side of your spring therefore the other side of the spring is offset. They are made by simply bending the last coil so they are more economical than cross over center hooks

GLOSSARY OF SPRING TERMS

Terms	Description
Active Coils	The coils that are free to deflect when under load.
Allow for Set	Spring is supplied longer than specified to compensate for length loss when fully compressed.
Angular Relationship to Ends	The relative position of the plane of the hooks or loops of extension springs to each other.
Buckling	Bowing or lateral deflection of compression springs when compressed, related to the slenderness ratio (L/D).
Closed Ends	Ends of compression springs where pitch of the end coils is reduced so that the end coils touch.
Closed & Ground Ends	Same as with closed ends, except that the end is ground to provide a flat plane.
Closed Length	Also called Solid Height. Height of a compression spring when under sufficient load to bring all the coils into contact with adjacent coils.
Close-Wound	Coiled with adjacent coils in contact.
Coils per Inch	Also called Pitch. The distance from center to center of the wire in adjacent active coils (recommended practice is to specify number of active coils rather than pitch).
Deflection	Motion of spring ends or arms under the application or removal of an external load.
Elastic Limit	Maximum stress to which a material may be subjected without producing permanent set.
Endurance Limit	Maximum stress at which any given material will operate indefinitely without failure for a given minimum stress.
Free Length	The overall length of a spring in the unloaded position.
Gradient	Also called Rate. Change on load per unit deflection, generally given in pounds per inch or Newtons per millimeter.
Helix	The spiral form (open or closed) of compression, extension and torsion springs.
Hooks	Open loops or ends of extension springs.
Hysteresis	The mechanical energy loss that always occurs under cyclic loading and unloading of a spring, proportional to the area between the loading and unloading load-deflection curves within the elastic range to a spring.
Initial Tension	The force that keeps the coils of an extension spring closed and which must be overcome before the coils start to open.
Load	The force applied to a spring that causes a deflection.
Loops	Coil-like wire shapes at the end of extension springs that provide for attachment and force application.
Mean Coil Diameter	Outside spring diameter (O.D.) minus one wire diameter.
Modulus in Shear	Coefficient of stiffness for extension and compression springs.
Modulus in Tension	Coefficient of stiffness used for torsion and flat springs (Young's Modulus).
Moment	Also called Torque. A twisting action in torsion springs which tends to produce rotation, equal to the load multiplied by the distance (or moment arm) from the load to the axis of the spring body. Usually expressed in inch-oz., inch-pounds or foot-pounds.
Open Ends. Not Ground	End of a compression spring with a constant pitch for each coil.
Open and Ground End	"Open ends, not ground" followed by an end grinding operation.
Permanent Set	A material that is deflected so far that its elastic properties have been exceeded and it does not return to its original condition upon release of load is said to have taken a "permanent set".
Pitch	The distance from center to center of the wire in adjacent active coils (recommended practice is to specify number of active coils rather than pitch).
Preset	Full compression of a spring to solid state by manufacturer when needed to prevent length loss in operation.
Rate	Change on load per unit deflection, generally given in pounds per inch or Newtons per millimeter.
Remove Set	Full compression of a spring to solid state by manufacturer when needed to prevent length loss in operation.
Residual Stress	Stresses induced by set removal, shot peening, cold working, forming and other means. These stresses may or may not be beneficial, depending on the application.
Set	Length loss in operation due to the high stress condition of the spring.
Slenderness Ratio	Ratio of spring length (L) to mean coil diameter (D).
Solid Height	Height of a compression spring when under sufficient load to bring all the coils into contact with adjacent coils.
Spring Index	Ratio of the mean coil diameter (D) to wire diameter (d).
Stress Range	The difference in operating stress at minimum and maximum loads.
Stress Relieve	To subject springs to low-temperature heat treatment so as to relieve residual stresses.
Shot Peened	A cold working process in which the material surface is peened to induce compressive stresses and thereby improve fatigue life.
Squareness of Ends	Angular deviation between the axis of a compression spring and a normal to the plane of the ends.
Squareness Under Load	Same as Squareness of Ends, except with the spring under load.
Torque	A twisting action in torsion springs which tends to produce rotation, equal to the load multiplied by the distance (or moment arm) from the load to the axis of the spring body. Usually expressed in inch-oz., inch-pounds or foot-pounds.
Total Coils	Number of active coils (n) plus the coils forming the ends.
Wahl Factor	A factor to correct stress in helical springs effects of curvature and direct shear.
